| Max Point Defect Density Surface 1 inside 170 mm diameter | 5 per 4 mm ² |
|---|--|
| Max Point Defects Surface 1 outside 170 mm to 255 mm diameter | N/A |
| Max Point Defects Surface 2 inside 170 mm diameter | N/A |
| General to All Surfaces | |
| Coating Thickness Uniformity | Fractional Change <0.001 over 170 mm diameter. If the physical thickness variation of the coating cannot be measured with a profilometer or inferred interferometrically, it may be inferred from the wavelength shift of the coating as a function of position. |
| v | |
| Coating Relative Wavelength Uniformity | Fractional Change < 0.001 over 170 mm diameter. |
| Coating Area | To Bevel |
| | Once Witness Piece Per Run: Coating to resist adhesion test per MIL-C-48497A 4.5.3.1 Adhesion (snap tape). MIL-C-4.5.3.2 Humidity (120F 95% RH for 24 hours), combined with before/after spectrophotometer scan from 400 - 2500 nm, marking the specimen ensure the same area is scanned. There should be no measureable spectral shift. MIL-C-4.5.3.3 Moderate Abrasion (cheesecloth |
| Witness Sample Durability Testing | rub). |
| Surface 1 | NOTE: ARROWS ON OPTIC SIDE POINT TO SURFACE 1 |
| Coating Type | High Reflection |

| | METHOD 1. |
|--|---|
| | The surface is examined visually by two observers independently. The examination is done against a dark background using a fiber optic illumination system of at least 200 W total power. A 100% inspection of the surface is carried out. Pits and scratches down to 2 micrometers in width can be detected using this method of inspection. Any scratches or sleeks that are detected will be measured using a calibrated eyepiece. |
| 6. Scratches & Point Defects Methods 1&2 (Hand Sketch). | METHOD 2. Further inspection will be done with a minimum 6X eyeglass using the same illumination conditions, again with two observers. Sleeks down to 0.5 micrometers wide can be detected using this method. The surface will be scanned along one or two chords from centre to edge, then at ten positions around the edge, and ten to fifteen positions near the centre. METHOD 3. |
| | An inspection is then carried out with a dark or bright field microscope, with 5x objective at four positions at each of the following locations: a) Within 10mm of the center of the surface. b) Equally spaced along the circumference of a centered, 60 mm diameter circle. |
| 7. Scratches & Point Defects Method 3 (Digital Images). | c) Equally spaced along the circumference of a centered, 120 mm diameter circle. All samples from the durability tests and data, including spectrophotometer scans of the |
| 8. Durability Test Data & Samples. | representative coating on each side in an Excel spreadsheet. |
