1. Description

Block diagram

Description

The Acquisition unit consists of four identical channels and the power regulators which provide regulated power to the four channels. Each channel consists of a coil drive channel, and monitor circuitry.

The driver has 3 main modes of operation, selectable by two external relay commands: Noisy Mode, Quiet Mode and Acquisition Mode. There is also a mode which switches the channel off.

2. Test equipment

- Power supplies (At least +/- 20v variable, 1A)
- Signal generator (capable of delivering 10v peak, 0.1Hz to 10 KHz)
- Analogue oscilloscope
- Agilent Dynamic Signal Analyser (or similar)
- Low noise Balanced Driver circuit
- Relay test box

Record the Models and serial numbers of the test equipment used below.

5. TEST SET UP

Note:

(1) Input signal to differential amplifier is generally stated in the tests below. There is therefore an inherent gain of 2 in the system.

(2) Some signal generators will indicate 1vpk/pk when the output is in fact 1v Peak into the high impedance Differential driver used. The test procedure refers to the actual voltage out of the signal generator.

Connections:

Differential signal inputs to the board under test:

Drive Input J3 pins 1, 2, 3, 4 = positive input

Drive Input J3 pins 6, 7, 8, 9 = negative input

Drive Input J3 pin 5 = ground

Power

DC IN J1 pin 9, 10 = +16.5v

DC IN J1 pin 11,12 = -16.5

DC IN J1 pins 22, 23, 24, 25 = 0v

6. Power

Check that the 3 pin power connector is wired correctly: A1 positive, A2 return, A3 Negative.

Set the power supply outputs to zero.

Connect power to the unit

Increase the voltages on the supplies to +/-3V.

Determine that the supply polarities are correct on TP1 and TP2.

If they are, increase input voltages to +/- 16.5v.

Record the output voltages, measured on a DVM with 4 or more digits, from each regulator

Observe the output on an analogue oscilloscope, set to AC. Measure and record the peak to peak noise on each regulator output.

Record regulator outputs:

| Regulator | Output voltage | Nominal +/- 0.5v? | Output noise |
|-----------|----------------|-------------------|--------------|
| +12v TP5 | | | |
| +15v TP4 | | | |
| -15v TP6 | | | |

| | |
|---|--|
| All Outputs smooth DC, no oscillation? | |
|---|--|

Record Power Supply Currents

| Supply | Current |
|--------|---------|
| +16.5v | |
| -16.5v | |

If the supplies are correct, proceed to the next test.

8. Monitor Outputs

Switch out the filters and set the unit to Acquisition Mode.

With a 20 ohm dummy load on each channel, apply an input from the signal generator at 1 KHz, and adjust the amplitude until the output is 1vr r.m.s as measured between TP4 and TP5.

Measure the Voltage Monitor outputs with respect to 0v for each channel.

8.1 Voltage Monitors

| Ch. | Output: | V, I and R.M.S Monitor | Expected value | Pass/Fail: Equal? (+/- 0.1v) |
|-----|---------|------------------------|----------------|------------------------------|
| 1 | | 10 | 0.33v | |
| 2 | | 7 | 0.33v | |
| 3 | | 4 | 0.33v | |
| 4 | | 1 | 0.33v | |

Adjust the input voltage until the voltage across the load resistor = 1v rms.
 Record the current monitor output values.

8.2 Current Monitors

| Ch. | Output | V, I and R.M.S Monitor | Expected Value | Pass/Fail: Equal? (+/- 0.1v) |
|-----|--------|------------------------|----------------|------------------------------|
| 1 | | 11 | 1.86v r.m.s | |
| 2 | | 8 | 1.86v r.m.s | |
| 3 | | 5 | 1.86v r.m.s | |
| 4 | | 2 | 1.86v r.m.s | |

8.3 R.M.S Monitors

| Ch. | Output | V, I and R.M.S Monitor | Expected Value | Pass/Fail: Equal? (+/- 0.1v) |
|-----|--------|------------------------|----------------|------------------------------|
| 1 | | 12 | 1.86v dc | |
| 2 | | 9 | 1.86v dc | |
| 3 | | 6 | 1.86v dc | |
| 4 | | 3 | 1.86v dc | |

8.4 Noise Monitors

Using the Pre-Amplifier with a gain of 10 and Dynamic Signal Analyser, measure the noise monitor outputs in $\mu\text{V}/\sqrt{\text{Hz}}$ on the noise monitor outputs. Correct for the pre-amplifier gain. $10\text{pA}/\text{rt Hz}$ should give $0.825\mu\text{V}/\mu\text{Hz}$ out.

| Ch. | Output | /(Pre-amplifier gain) | Expected Value | Comparison |
|-----|--------|-----------------------|---------------------------------|------------|
| 1 | | | $0.825\mu\text{V}/\mu\text{Hz}$ | |
| 2 | | | $0.825\mu\text{V}/\mu\text{Hz}$ | |
| 3 | | | $0.825\mu\text{V}/\mu\text{Hz}$ | |
| 4 | | | $0.825\mu\text{V}/\mu\text{Hz}$ | |

11. Noise Measurements

As the previous test involves non – representative temperature rises, allow the unit to cool before performing this test.

Replace the filter links W4, on each channel.

Connect the filter test box, and switch in all filters.

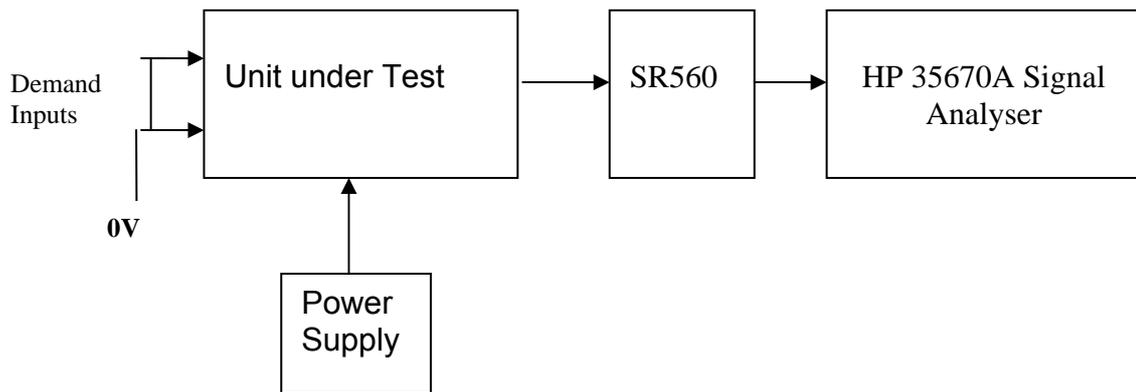

Switch it out of Test Mode and out of the Acquisition mode

Use the HP 35670A Dynamic Signal Analyser.

Connect a shorting plug to the demand input to short all positive and negative demands together and to 0v. Connect 20 Ohm loads to the outputs.

Use Stuart Aston’s noise measurement set up, loaded from disc.

Measure the noise output from each channel in turn at the amplifier outputs (TP4 and TP5). The Low Pass filter on the SR650 may be used to reduce mains interference, to prevent the Signal Analyser from overloading. Ideally the filter corner frequency should be set to 3 KHz. Set the amplifier gain to 1000, and check that the overload light is not on before each measurement.

Measure the noise output at 10 Hz.

| | Spec in dB V/√Hz | Measured @ 10Hz | -60dB = | Measured in nV/√Hz | OK? |
|-----|---------------------|--------------------|---------|-----------------------|-----|
| Ch1 | -143.5 | | | | |
| Ch2 | -143.5 | | | | |
| Ch3 | -143.5 | | | | |
| Ch4 | -143.5 | | | | |

Notes:

Specified noise output current at 10 Hz = 10pA/root Hz (worst case)

Total resistance at 10Hz, in Low noise mode = 6.7K

Amplifier noise voltage should therefore be = 67 nV/√Hz

67 nV/√Hz = -143.5 dB/√Hz

12. Final Assembly Tests

1. Remove the lid of the box.
2. Unplug all external connections.
3. Check that the 9mm pillars are in place in the corners of the Monitor Board towards the centre of the box.
4. Check that all internal connectors are firmly mated.
5. Tighten the screw-locks holding all the external connectors.
6. Check that the nuts holding the tabs of the power drivers are secure – tighten as necessary. Test with a DVM that none of the tabs are shorted to chassis.
7. Check that all the LEDs are nicely centred.
8. Check that all links W4 and W2 are in place.
9. Check that the boards are labelled with their Drawing Number, Issue Number, and serial number. Record below:

| | |
|-----------------------------------|--|
| UoB box ID | |
| Driver board ID | |
| Driver board Drawing No/Issue No | |
| Driver board Serial Number | |
| Monitor board ID | |
| Monitor board Drawing No/Issue No | |
| Monitor board Serial Number | |

10. Check the security of any modification wires.
11. Visually inspect.
12. Put the lid on and fasten all screws,
Check all external screws for tightness.
