and Space Time Research

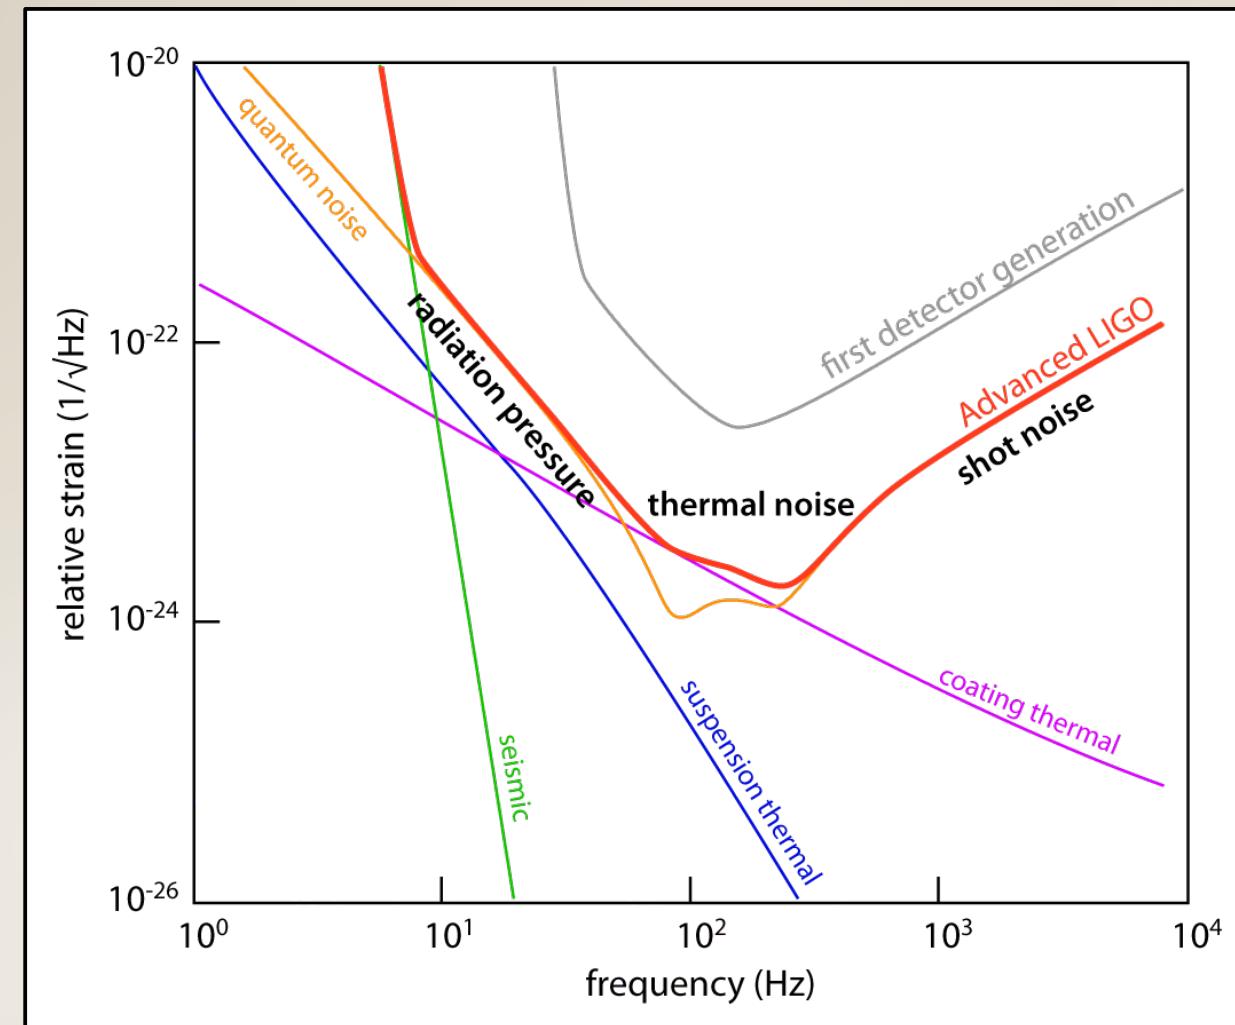

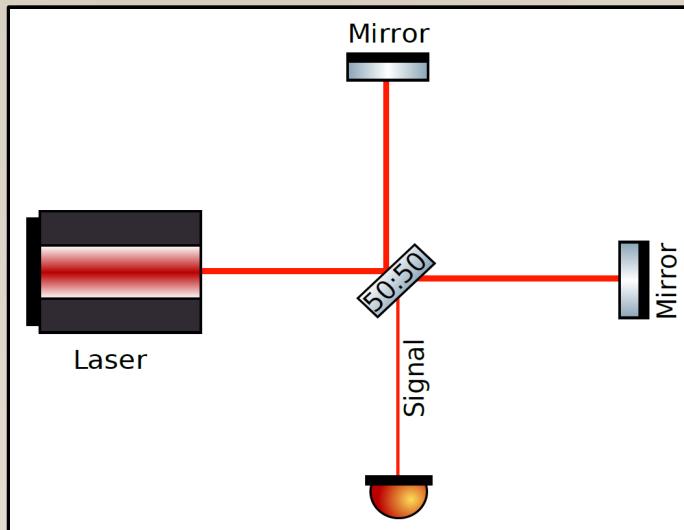

Leibniz Universität Hannover

Institute for Gravitational Physics, Leibniz Universität Hannover
and Max Planck Institute for Gravitational Physics (Albert
Einstein Institute)
Callinstr. 38, 30167 Hannover, Germany

Michelson interferometer

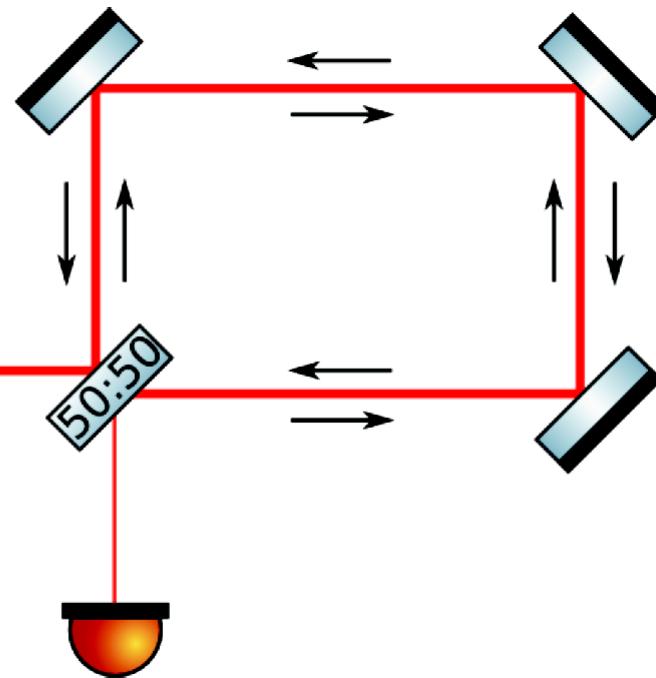

www.squeezed-light.de

The Sagnac interferometer

- Sensitive to rotations
- Always dark at the south output port (with perfect 50:50 splitting ratio)
- Not sensitive to reciprocal phase shifts

Radiation Pressure Noise

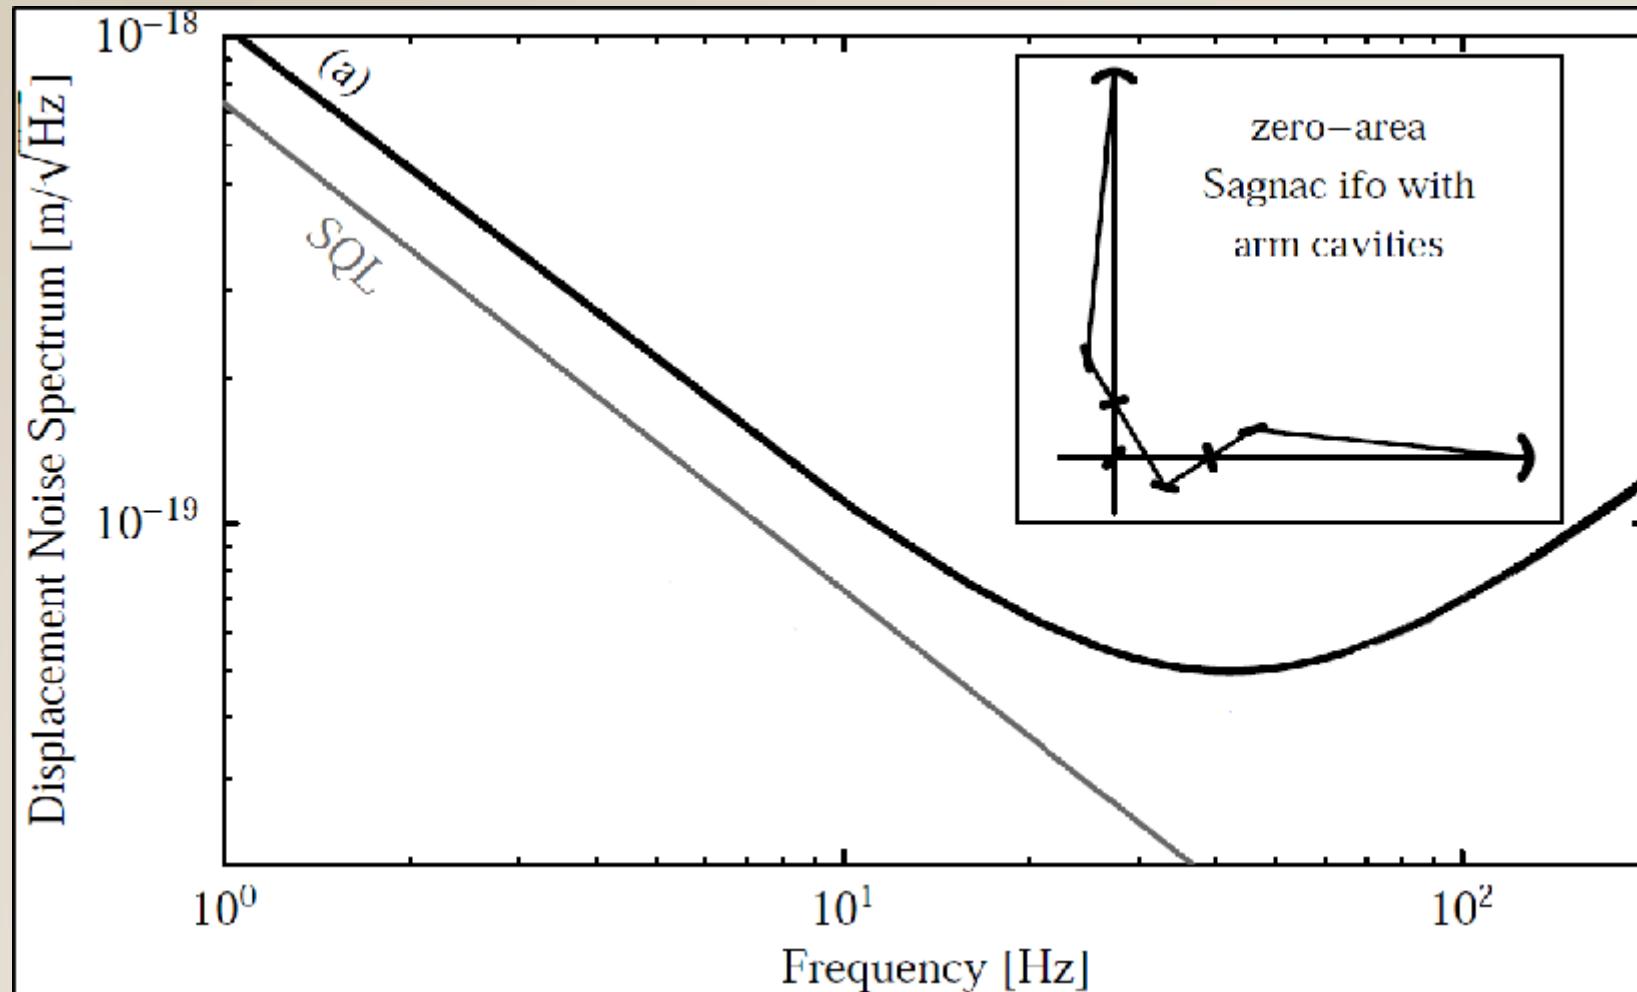

Sagnac Interferometer is a
Quantum Non-Demolition
Device, because

- it is a speed-meter
- The Hamiltonian of a free-falling test mass is $H=p^2/2m$

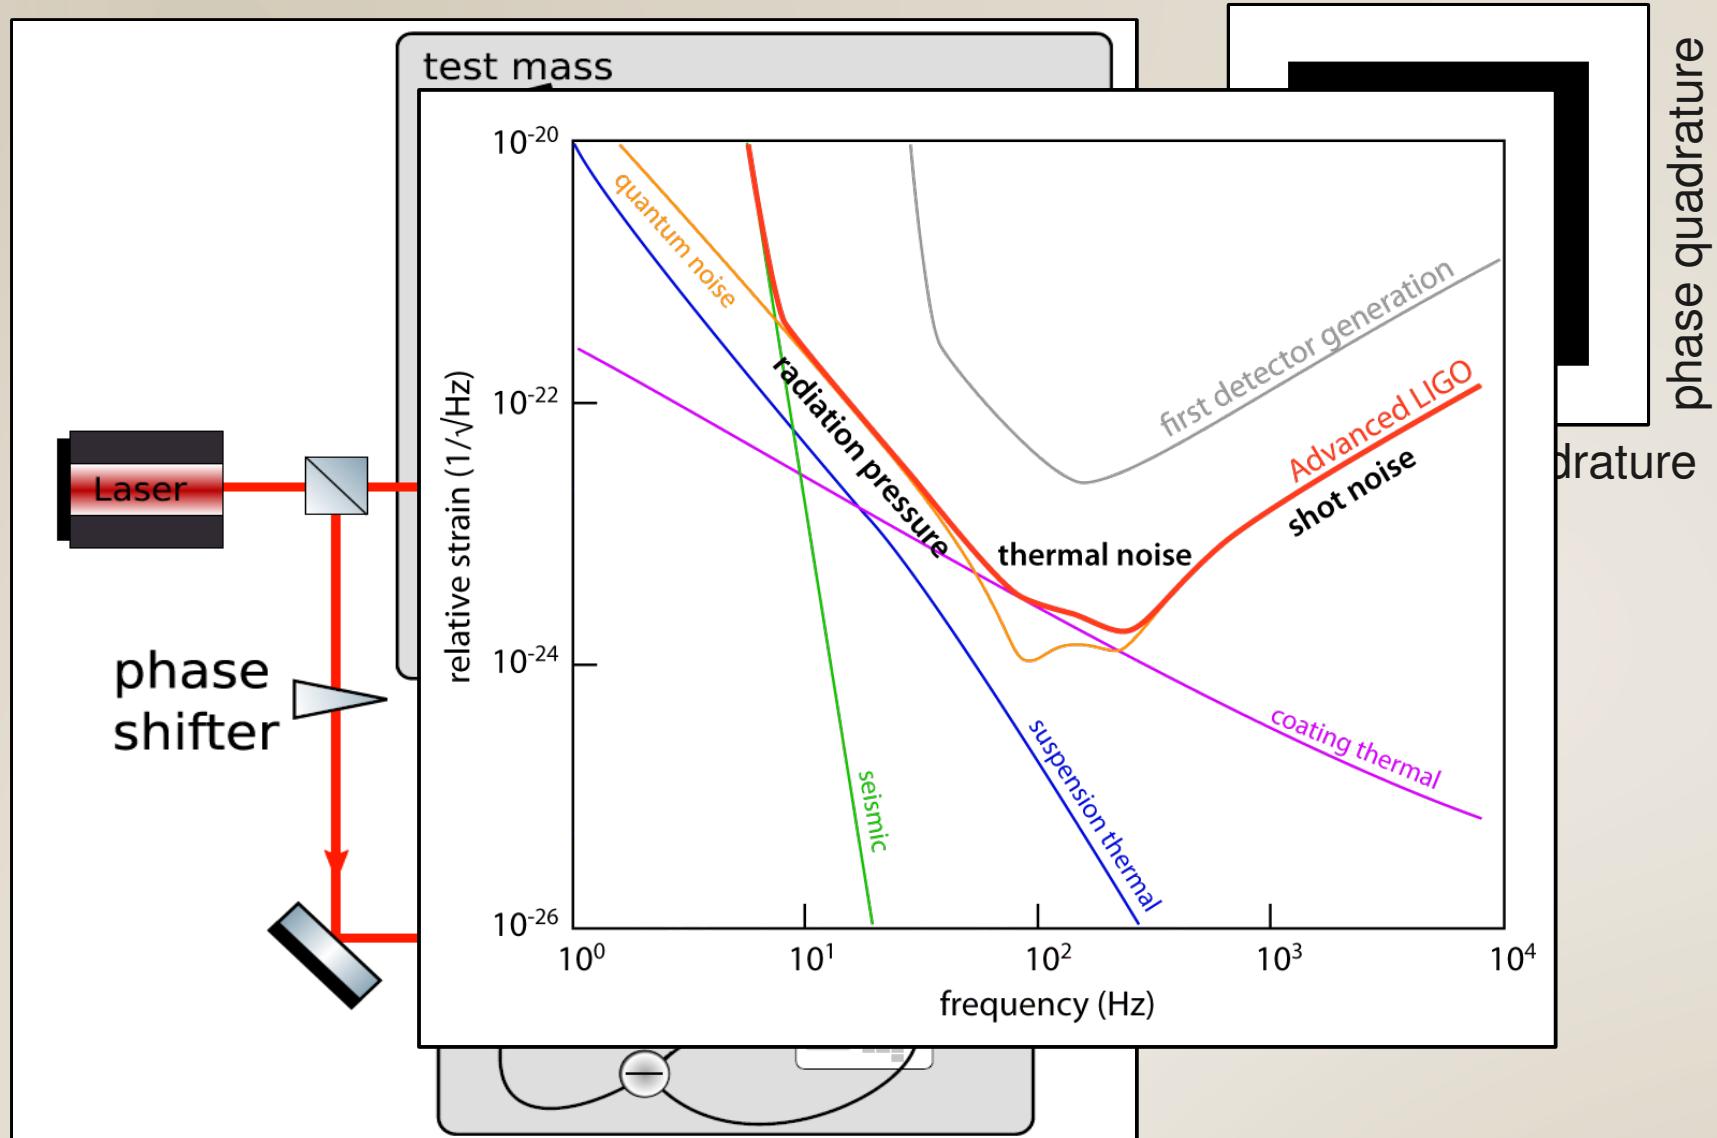

→ **Radiation pressure
noise is canceled**

Hannover

Experimental results:

- 8.2 dB non-classical noise reduction of a zero-area Sagnac ifo
- Generation of 12.7 dB squeezing
- Sagnac interferometer might be interesting for future GW detectors
 - Cancels radiation pressure noise
 - Can be enhanced by squeezed light without the need of filter cavities
