

# **Optical Coatings for Gravitational Wave Detection**

***Gregory Harry***

**Massachusetts Institute of Technology  
- On Behalf of the LIGO Science Collaboration -**

**August 4, 2004  
The International Symposium on  
Optical Science and Technology  
Denver CO**

## Gravitational Wave Detection

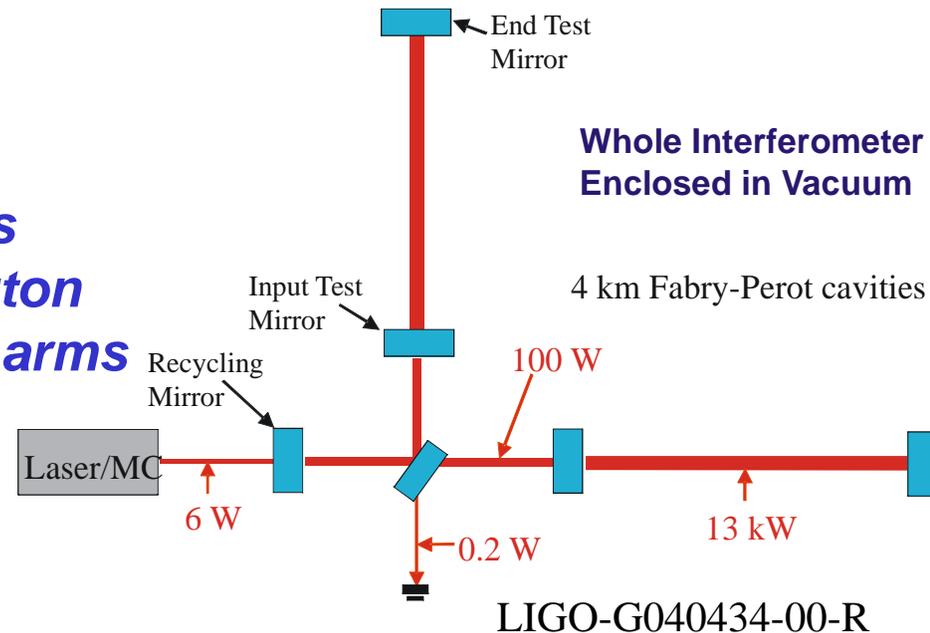

- *Gravitational waves predicted by Einstein*
- *Accelerating masses create ripples in space-time*
- *Need astronomical sized masses moving near speed of light to get detectable effect*

**LIGO**

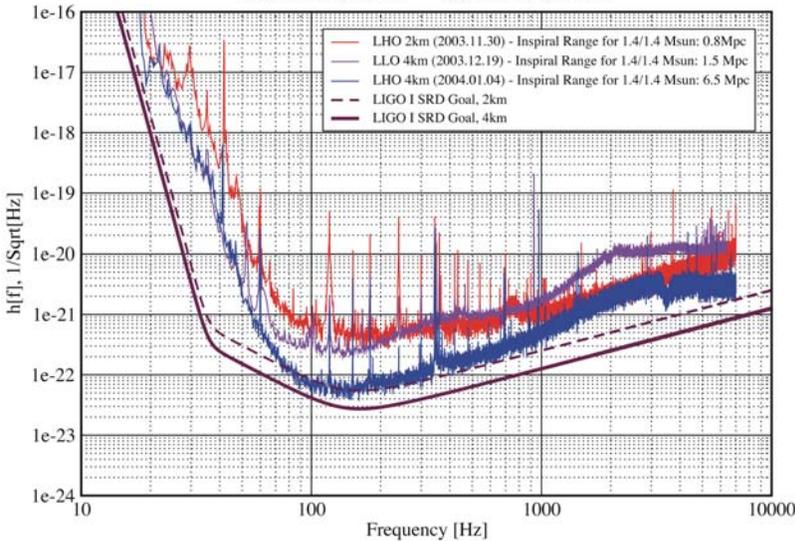

- *Two 4 km and one 2 km long interferometers*
- *Two sites in the US, Louisiana and Washington*
- *Michelson interferometers with Fabry-Perot arms*
- *Whole optical path enclosed in vacuum*
- *Sensitive to strains around  $10^{-21}$*

# Interferometer Sensitivity

Strain Sensivities for the LIGO Interferometers

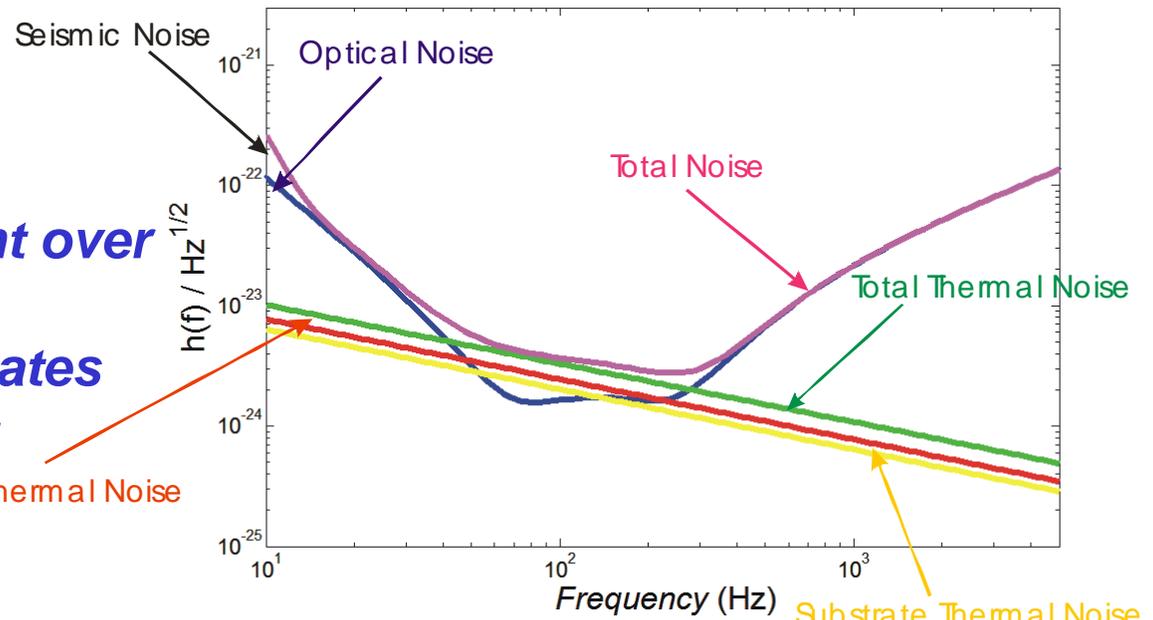

Best S3 Performance LIGO-G040023-00-E

- Measured sensitivity of initial LIGO 1/2004
- Nearing design goal
- Hanford 4 km within a factor of 2 near 100 Hz

- Design sensitivity of proposed Advanced LIGO
- Factor of 15 in strain improvement over initial LIGO
- Thermal noise from mirror substrates and coatings sets sensitivity limit

Coating Thermal Noise

LIGO-G040434-00-R

# Coating Thermal Noise

## *Fluctuation-Dissipation Theorem*

$$S_F(f) = 4 k_B T \operatorname{Re}[Z]$$

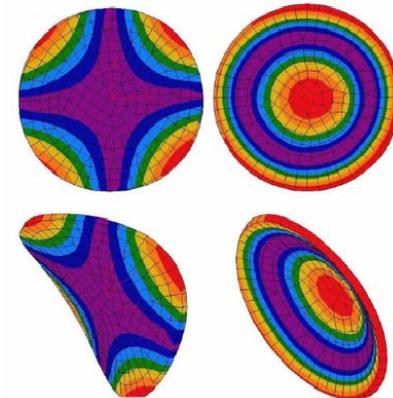

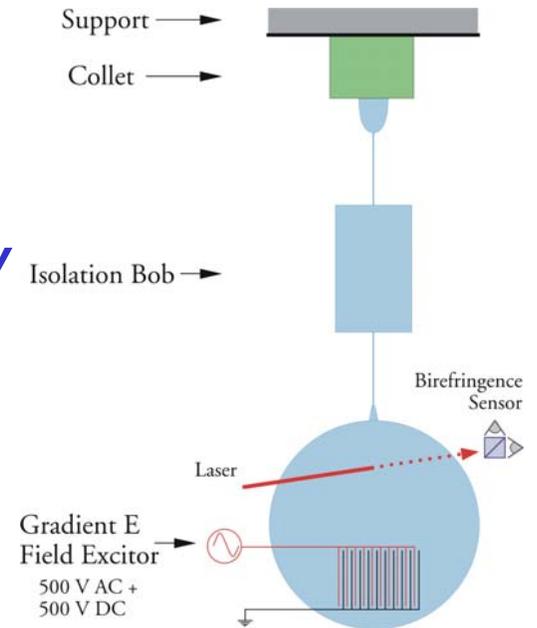

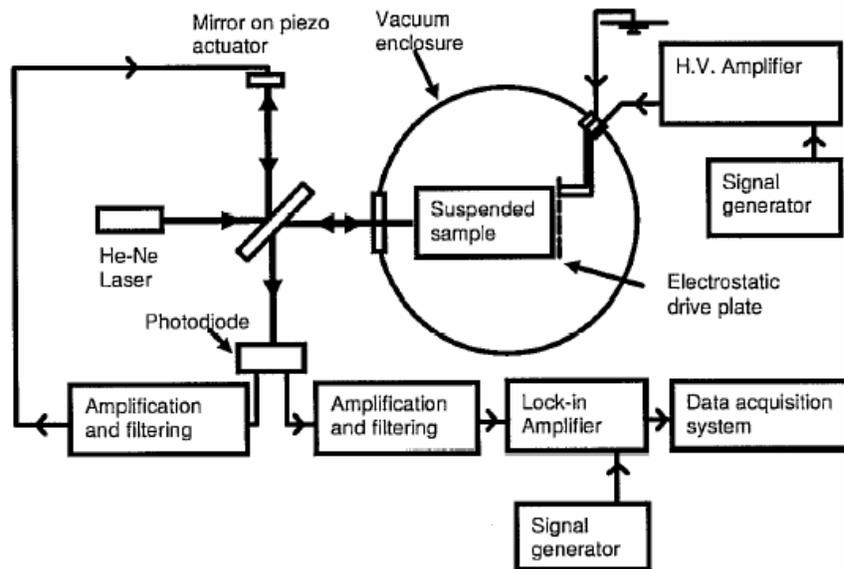

- *Fluctuation-Dissipation Theorem predicts noise from mechanical loss*
- *Proximity of coating to readout laser means thermal noise from coatings is directly measured*
- *Initial LIGO has 40 layer silica/tantala dielectric coatings optimized for low optical absorption*

$$S_x(f) = 2 k_B T / (\pi^{3/2} f w Y) ( \phi + d / (\pi^{1/2} w) ( Y / Y_{\text{perp}} \phi_{\text{perp}} + Y_{\text{para}} / Y \phi_{\text{para}} ) )$$

# Coating Mechanical Loss Experiments

## Modal Q Measurements

- Test coatings deposited on silica substrates
- Normal modes (2 kHz to 50 kHz) decay monitored by interferometer/birefringence sensor.
- Coating loss inferred from modal Q and finite element analysis modelling of energy distribution
- Can examine many different coatings fairly quickly

# Results of Q Measurements

## Coating Mechanical Loss

| Layers | Materials  | Loss Angle          |
|--------|--|---------------------|
| 30     | <sup>a</sup> $\lambda/4$ SiO <sub>2</sub> - $\lambda/4$ Ta <sub>2</sub> O <sub>5</sub>               | $2.7 \cdot 10^{-4}$ |
| 60     | <sup>a</sup> $\lambda/8$ SiO <sub>2</sub> - $\lambda/8$ Ta <sub>2</sub> O <sub>5</sub>               | $2.7 \cdot 10^{-4}$ |
| 2      | <sup>a</sup> $\lambda/4$ SiO <sub>2</sub> - $\lambda/4$ Ta <sub>2</sub> O <sub>5</sub>               | $2.7 \cdot 10^{-4}$ |
| 30     | <sup>a</sup> $\lambda/8$ SiO <sub>2</sub> - $3\lambda/8$ Ta <sub>2</sub> O <sub>5</sub>              | $3.8 \cdot 10^{-4}$ |
| 30     | <sup>a</sup> $3\lambda/8$ SiO <sub>2</sub> - $\lambda/8$ Ta <sub>2</sub> O <sub>5</sub>              | $1.7 \cdot 10^{-4}$ |
| 30     | <sup>b</sup> $\lambda/4$ SiO <sub>2</sub> - $\lambda/4$ Ta <sub>2</sub> O <sub>5</sub>               | $3.1 \cdot 10^{-4}$ |
| 30     | <sup>c</sup> $\lambda/4$ SiO <sub>2</sub> - $\lambda/4$ Ta <sub>2</sub> O <sub>5</sub>               | $4.1 \cdot 10^{-4}$ |
| 30     | <sup>d</sup> $\lambda/4$ SiO <sub>2</sub> - $\lambda/4$ Ta <sub>2</sub> O <sub>5</sub>               | $5.3 \cdot 10^{-4}$ |
| 30     | <sup>b</sup> $\lambda/4$ SiO <sub>2</sub> - $\lambda/4$ Nb <sub>2</sub> O <sub>5</sub>               | $2.8 \cdot 10^{-4}$ |
| 43     | <sup>e</sup> $\lambda/4$ Al <sub>2</sub> O <sub>3</sub> - $\lambda/4$ Ta <sub>2</sub> O <sub>5</sub> | $2.9 \cdot 10^{-4}$ |

- Loss is caused by internal friction in materials, not by interface effects
- Differing layer thickness allow individual material loss angles to be determined

$$\begin{aligned} \phi_{\text{Ta}_2\text{O}_5} &= 4.6 \cdot 10^{-4} \\ \phi_{\text{SiO}_2} &= 0.2 \cdot 10^{-4} \\ \phi_{\text{Al}_2\text{O}_3} &= 0.1 \cdot 10^{-4} \\ \phi_{\text{Nb}_2\text{O}_5} &= 6.6 \cdot 10^{-4} \end{aligned}$$

**Goal :  $\phi_{\text{coat}} = 5 \cdot 10^{-5}$**

<sup>a</sup> LMA/Virgo, Lyon, France

<sup>b</sup> MLT Technologies, Mountain View, CA

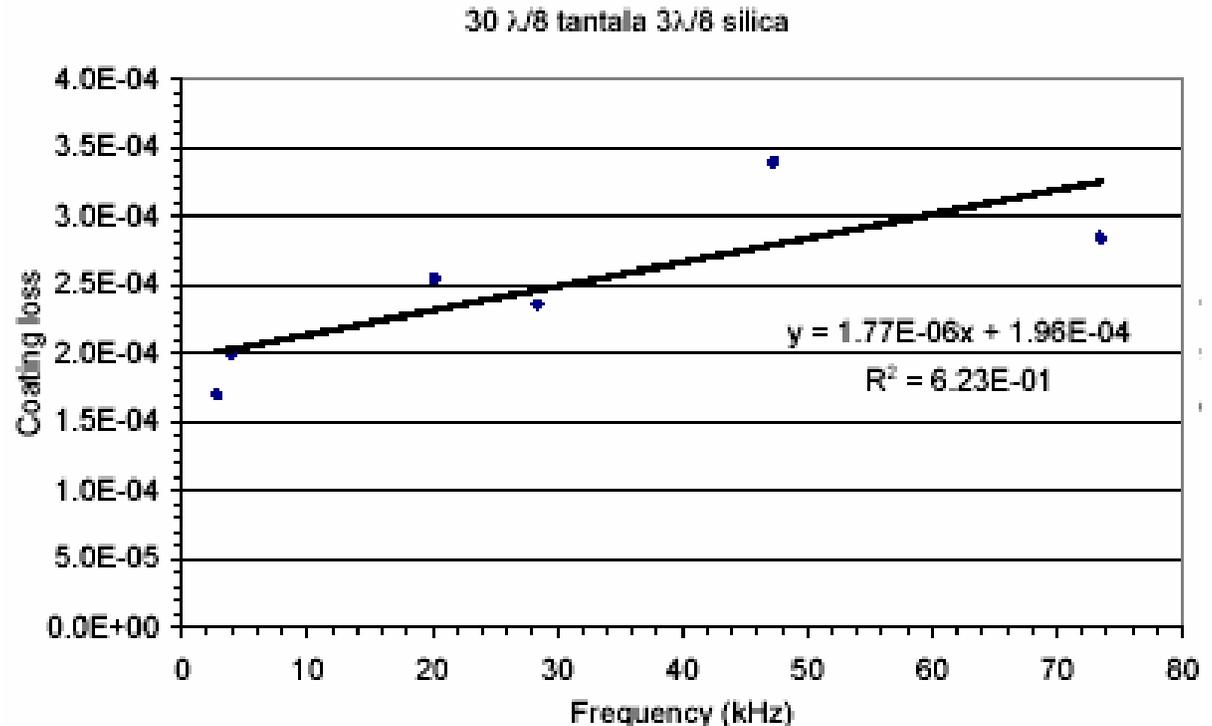

<sup>c</sup> CSIRO Telecommunications and Industrial Physics, Sydney, Australia

<sup>d</sup> Research-Electro Optics, Boulder, CO

<sup>e</sup> General Optics (now WavePrecision, Inc) Moorpark, CA

# Frequency Dependence of Coating Loss

- Evidence of frequency dependence of coating mechanical loss
- Coating loss lower at lower frequencies, so in LIGO's favor
- Primarily in  $\text{SiO}_2$
- Frequency dependence known in bulk silica
- Results rely on small number of thin sample modes

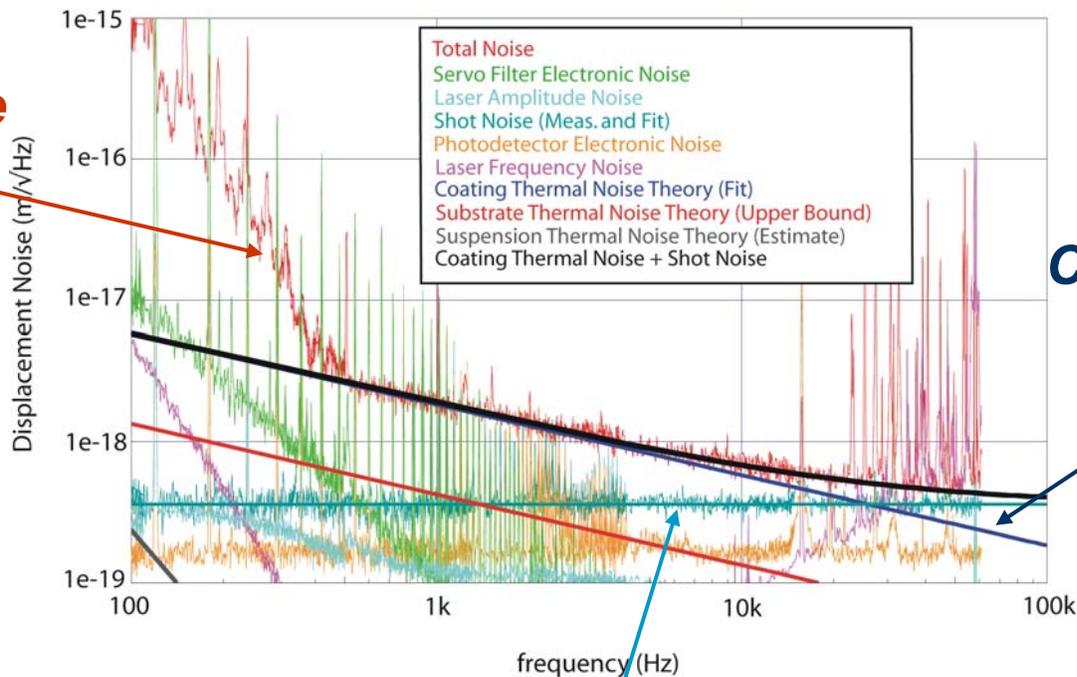

$$\phi_{\text{Ta}_2\text{O}_5} = (4.9 \pm 0.4) 10^{-5} - (1.8 \pm 2.5) 10^{-10}$$

$$\phi_{\text{SiO}_2} = (2.7 \pm 5.7) 10^{-5} + (2.5 \pm 0.3) 10^{-9}$$

# Direct Measurement of Coating Thermal Noise

- *LIGO/Caltech's Thermal Noise Interferometer*
- *1 cm long arm cavities, 0.15 mm laser spot size*
- *Consistent with  $\sim 4 \cdot 10^{-4}$  coating loss angle*

TNI Noise Curve - Fused Silica Mirrors

**Measured Noise**

**Coating Thermal Noise**

**Laser Shot Noise**

# Advanced LIGO Coating Requirements

*Need to develop low thermal noise coating without sacrificing optical performance.*

| <i>Parameter</i>                    | <i>Requirement</i>                  | <i>Current Value</i>                      |
|-------------------------------------|-------------------------------------|---|
| <i>Loss Angle <math>\phi</math></i> | <i><math>5 \cdot 10^{-5}</math></i> | <i><math>1.5 \cdot 10^{-4}{}^a</math></i> |
| <i>Optical Absorption</i>           | <i>0.5 ppm</i>                      | <i>1 ppm<sup>a</sup></i>                  |
| <i>Scatter</i>                      | <i>2 ppm</i>                        | <i>20 ppm<sup>b</sup></i>                 |
| <i>Thickness Uniformity</i>         | <i><math>10^{-3}</math></i>         | <i><math>8 \cdot 10^{-3}{}^b</math></i>   |
| <i>Transmission</i>                 | <i>5 ppm</i>                        | <i>5.5 ppm<sup>b</sup></i>                |
| <i>Transmission Matching</i>        | <i><math>5 \cdot 10^{-3}</math></i> | <i><math>5 \cdot 10^{-3}{}^b</math></i>   |

*Current values are from*

*<sup>a</sup> small laboratory samples*

*<sup>b</sup> installed optics in initial LIGO interferometers*

*No single sample has demonstrated all values.*

# Titania Dopant in Tantalum

*Work done in collaboration with LMA/Virgo in Lyon, France as part of advanced LIGO coating research*

*$\lambda/4$  SiO<sub>2</sub> –  $\lambda/4$  Ta<sub>2</sub>O<sub>5</sub> Coatings with TiO<sub>2</sub> dopant*

| <i>Dopant Conc.</i> | <i>Loss Angle</i>          |
|---------------------|----------------------------|
| <i>None</i>         | <i>2.7 10<sup>-4</sup></i> |
| <i>Low</i>          | <i>1.8 10<sup>-4</sup></i> |
| <i>Medium</i>       | <i>1.6 10<sup>-4</sup></i> |
| <i>High</i>         | <i>?</i>                   |

*Increasing dopant concentration reduces mechanical loss*

- How far can this effect be pushed?*
- Is there a better dopant?*
- Will this compromise optical performance?*

# Secondary Ion-beam Bombardment

*Work done in collaboration with CSIRO in Sydney, Australia as part of advanced LIGO coating research*

## *$\lambda/4$ SiO<sub>2</sub> – $\lambda/4$ Ta<sub>2</sub>O<sub>5</sub> Coatings*

| <i>Mode</i> | <i><math>\phi_{\text{coat}}</math></i> |                            |
|-------------|--|----------------------------|
|             | <i>Grid 1</i>                          | <i>Grid 2</i>              |
| <i>7</i>    | <i>4.1 10<sup>-4</sup></i>             | <i>3.2 10<sup>-4</sup></i> |
| <i>8</i>    | <i>4.2 10<sup>-4</sup></i>             | <i>3.1 10<sup>-4</sup></i> |
| <i>9</i>    | <i>5.0 10<sup>-4</sup></i>             | <i>4.0 10<sup>-4</sup></i> |
| <i>10</i>   | <i>4.1 10<sup>-4</sup></i>             | <i>3.5 10<sup>-4</sup></i> |
| <i>12</i>   | <i>4.4 10<sup>-4</sup></i>             | <i>2.3 10<sup>-4</sup></i> |

*Grid was adjusted from 1 to 2 to increase uniformity*

- How far can this effect be pushed?*
- Will this compromise optical performance?*

# Future Plans

---

- *Continue with  $\text{TiO}_2$  doped  $\text{Ta}_2\text{O}_5$  up to stability limit of  $\text{TiO}_2$  films*
  - *Examine other dopants in  $\text{Ta}_2\text{O}_5$*
  - *Examine other high index materials*
  - *Improve stoichiometry of  $\text{Ta}_2\text{O}_5$ , correlate with optical absorption*
  - *Examine relationship between annealing and mechanical loss*
- Need more input and collaboration with material scientists and optical engineers***
