

# Upconversion WG

- New subgroup of DetChar
- Tasked with identifying and reducing non-linear noise coupling
- Began meeting in May 2006
- Meets 1:30 PST every second Monday immediately following the commissioning telecon
- Lots of overlap with other groups

trend  
Similar for  
H2 & L1  
LHO iLog  
May 2

H0:DMT-BRMS-PEM-EX-SEISX-1-3 Hz

H0:DMT-BRMS-PEM-EX-SEISX-3-10 Hz

H1:DMT-DTQL-LSC-AS-Q-BAND-68-83

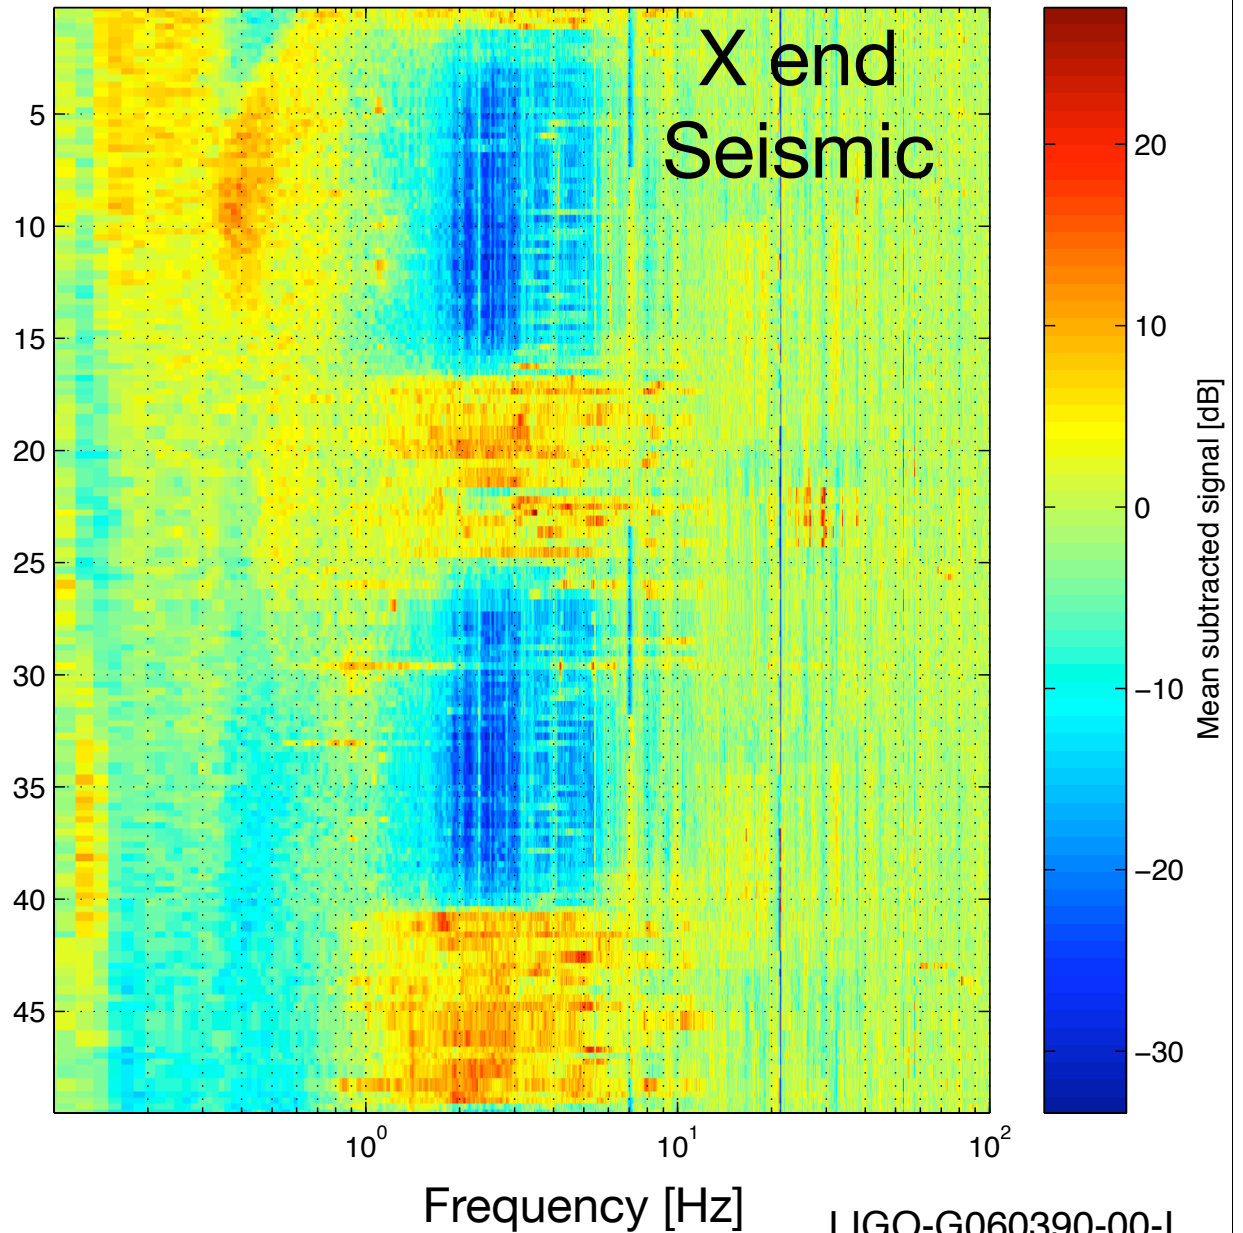

**LIGO**

72-80 Hz DARM power

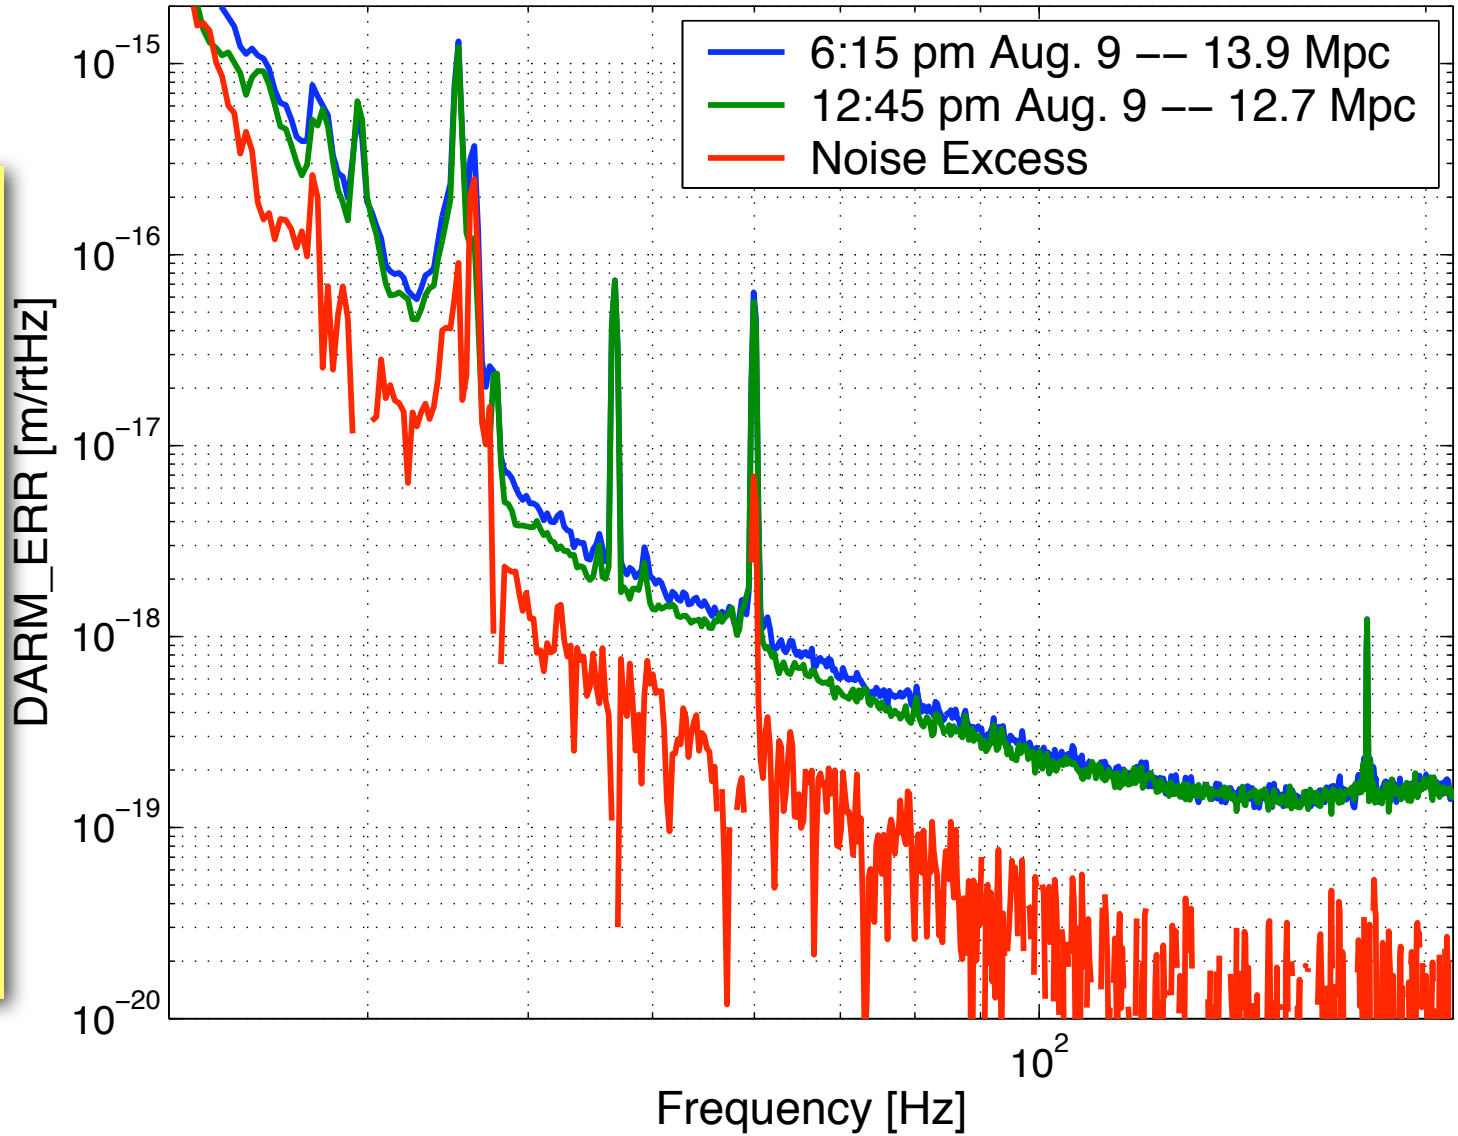

# 2-d coherence

# seismic Good vs. Bad

- 64 Avgs, 0.5 Hz BW
- $N \sim F^{-7/2}$
- 40-120 Hz

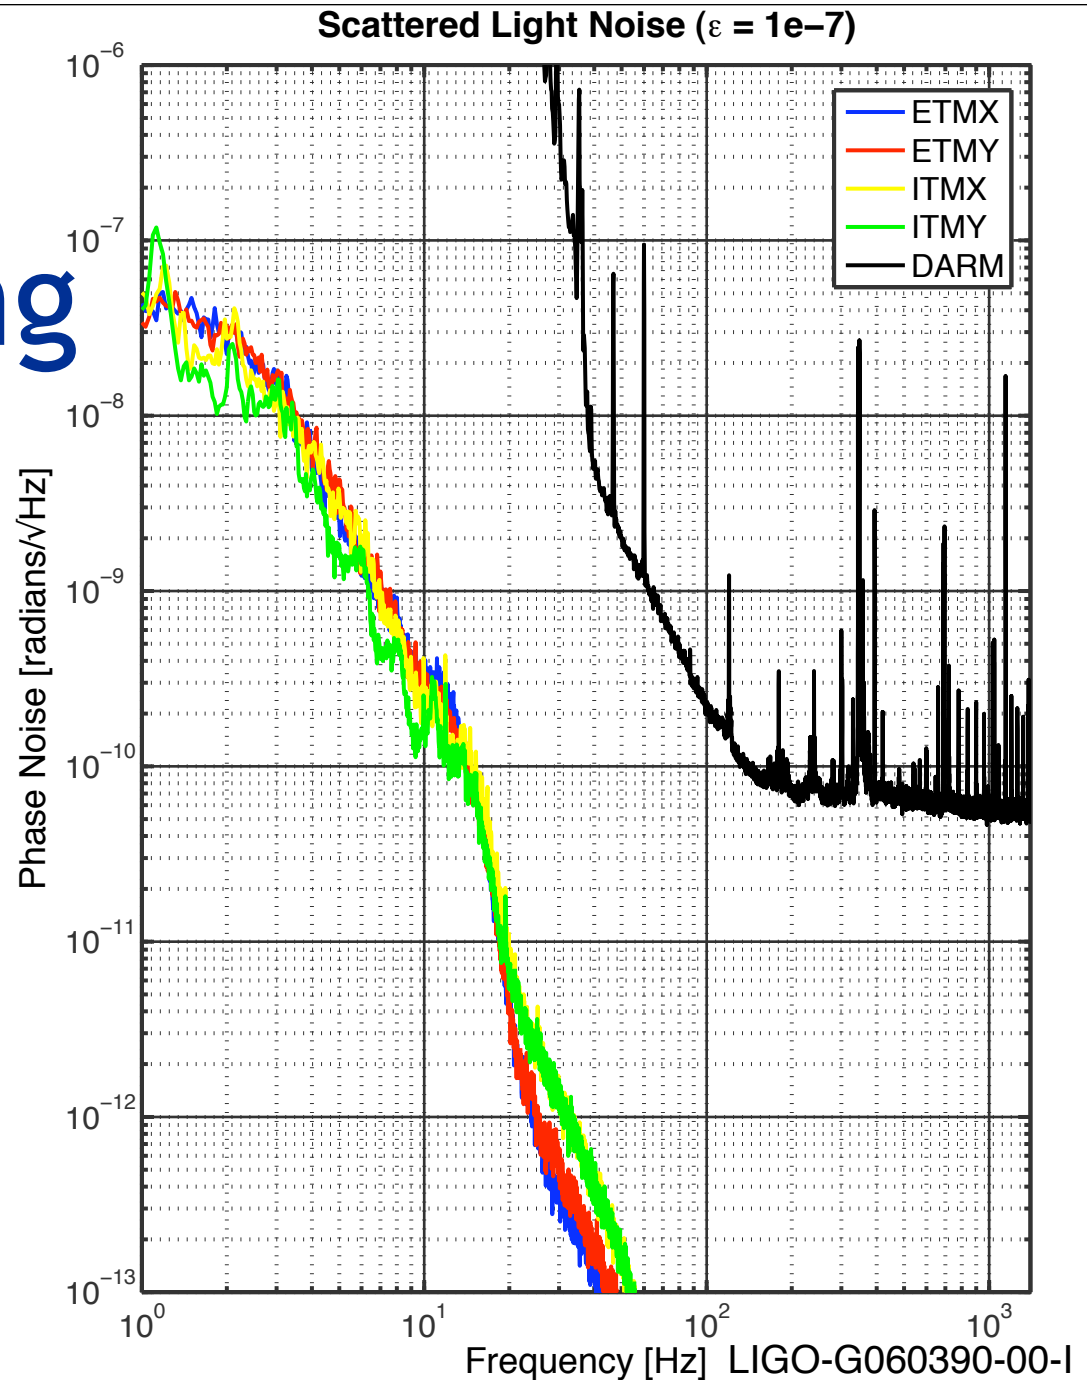

# Mechanisms

*Many have been proposed, few have been definitively ruled out*

- Barkhausen noise
- Charge motion
- Optical scattering
- Stick-slip suspension noise (eg. clamp)
- “Other” actuation noise
- Electronics noise

# LIGO Optical Scattering

- Use OSEM signals to determine optic-LOS cage motion
- Huge, efficient scatterers
- Orders of magnitude too low
- Many small scatterers?

# Seismic upconversion for 1.2 Hz floor shaking: April PEM injections

RMS in high f band as a function of RMS in low f band

- RMSS at LHO
- H1 & H2 see same U.C.

H\* DARM RMS in 65-115 Hz [ $m \times 10^{-18}$ ]

H\* DARM RMS in 0.3-4 Hz [ $m \times 10^{-8}$ ]

# not Optic Motion

Mid-Y ground injections: Black: none, Red: 0.75 Hz, Blue: 1.2 Hz

- 2/20/06 LHO elog
- ground injection
- + no ETM damping -> 10x MC\_F increase w/ no UC
- increase of DARM RMS != UC

Same color scheme

# LIGO

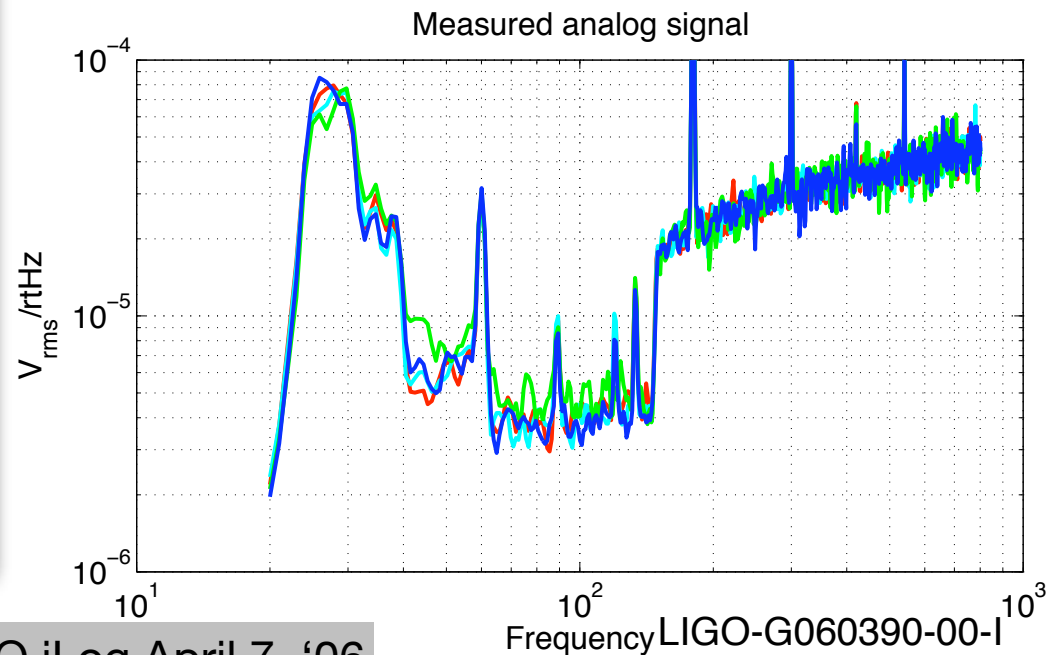

## Frequency dependence

- RMSS injection to LSC-ETMX\_EXC
- Approx. match upconversion
- Seems linear in acceleration

# LIGO Electronic UC

- Drive output w/ simulated signal
- Notch drive in bucket
- Measure analog coil driver output *in situ*
- Largest exc. @ 2.5 - 7 Hz (may) show UC

# Direct injection

- *In situ* single tone tests @ 10Hz
- Observed both distortion and broad band noise
- Not seen in the electronics shop
- Further testing in progress

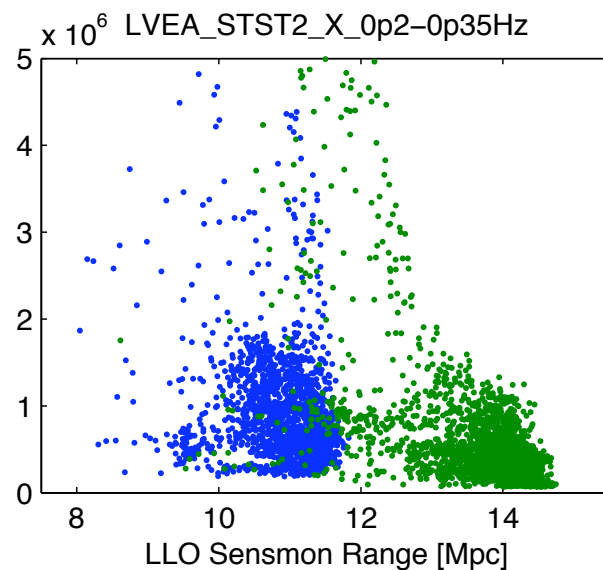

Input to coil driver and output corrected for hp filter

# LL0 seismic reprised

- Before/ After ITMY change
- Unequiv. seismic
- Increase in correlation
- Two corr slopes after

# LIGO State of the Upconversion

- Violin-mode Q measurements consistent w/ low wire loss and low thermal noise *but not all wires tested and clamp stick/slip may be an issue in the future*
- Optic motion alone insufficient to increase noise from free swinging CARM measurement
- Optical scattering probably not the dominant up-conversion mechanism
- Low F up-conversion caused by actuation force unrelated to suspension stack
- Actuation chain electronics are the probable cause for Low F up-conversion - “easily” fixable
- Retraction of the earth quake stops from LLO ITMY greatly reduced “baseline” noise - could be applied to all IFOs
- HVAC up-conversion noise effect still unexplained
