Amaldi 2017

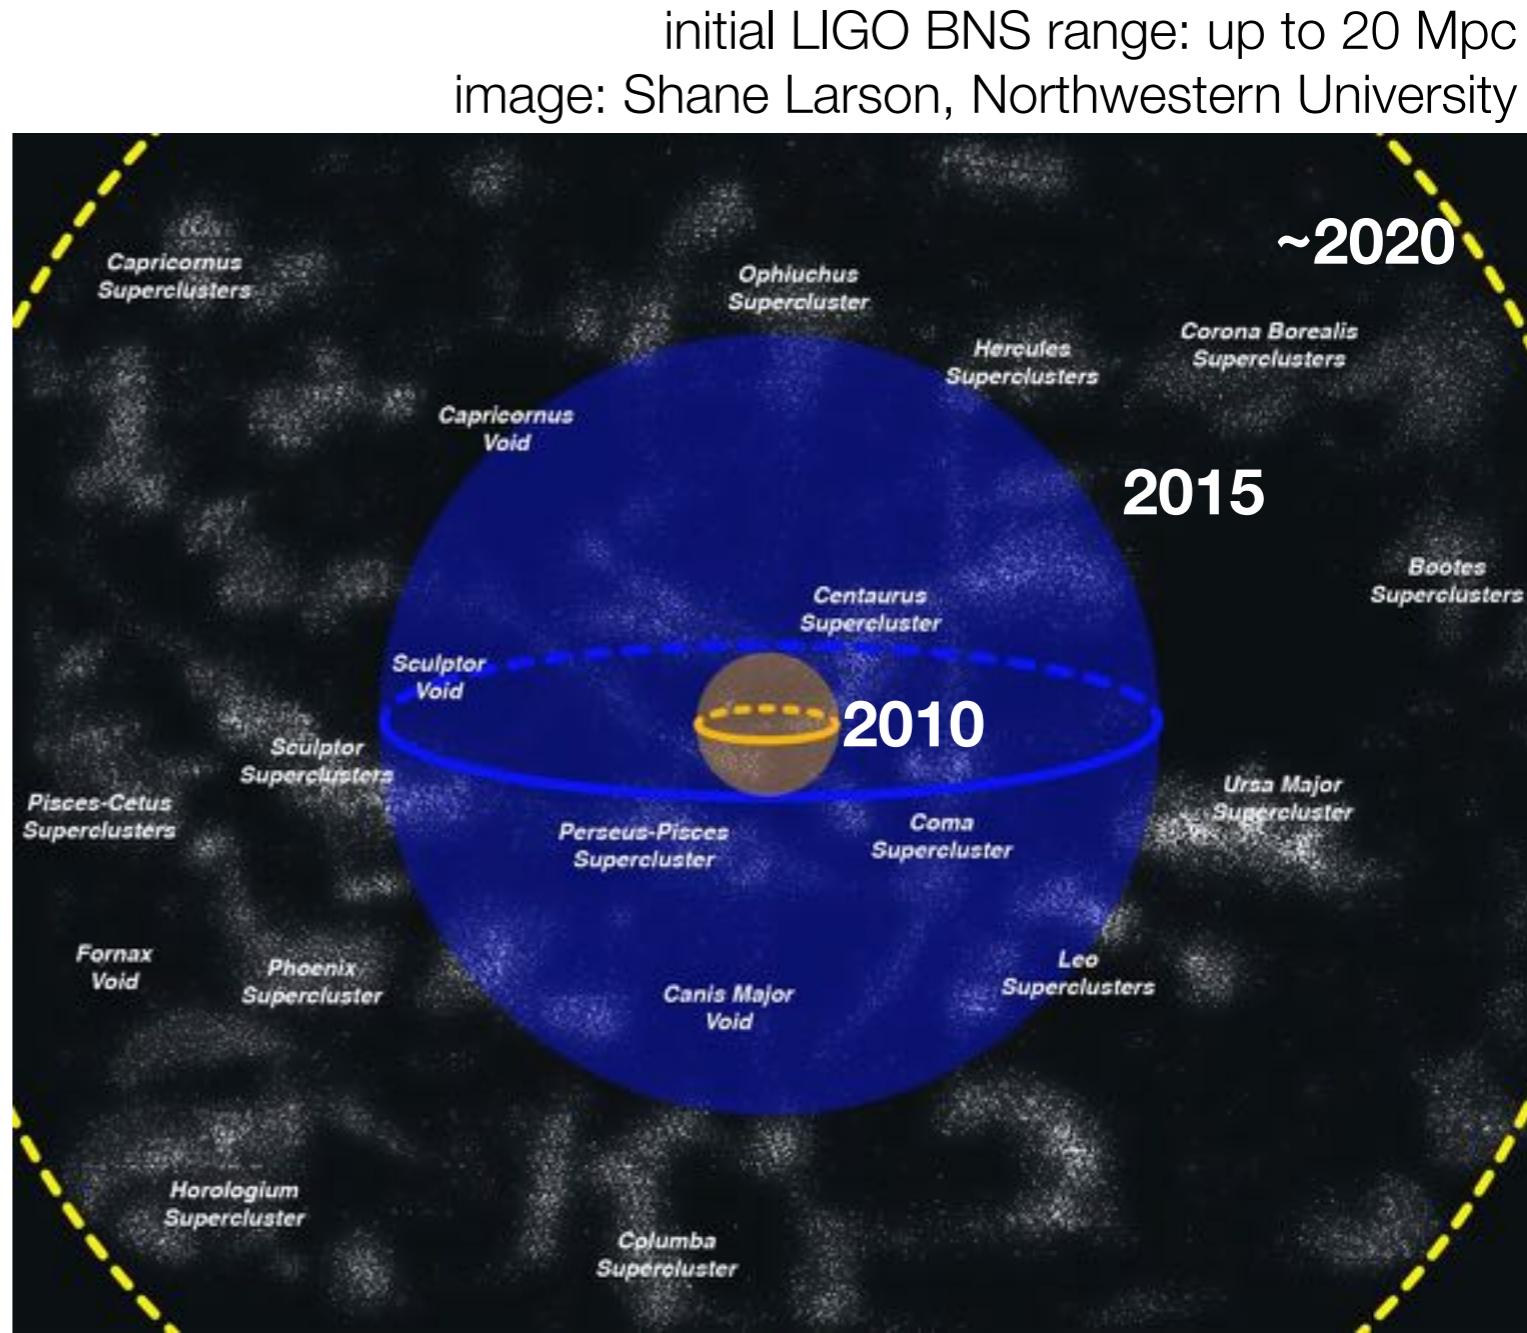

- Advanced LIGO results so far
  - Astrophysical implications
- Impact of matter on compact binaries
  - Measurement prospects and status
  - Waveform model

# Detection prospects of Advanced LIGO design

- binary neutron star mergers to  $\sim 200$  Mpc
- neutron star–( $10 M_{\text{sun}}$ ) black hole mergers to  $\sim 0.5$  Gpc
- ( $10-10 M_{\text{sun}}$ ) binary black hole mergers to  $\sim 1$  Gpc

(LIGO White Paper: <https://dcc.ligo.org/LIGO-T1400054/public>, rates above sky-averaged)

initial LIGO BNS range: up to 20 Mpc

image: Shane Larson, Northwestern University

$\sim 2020$

2010

2015

BNS expected  $0.4 - 400 \text{ yr}^{-1}$

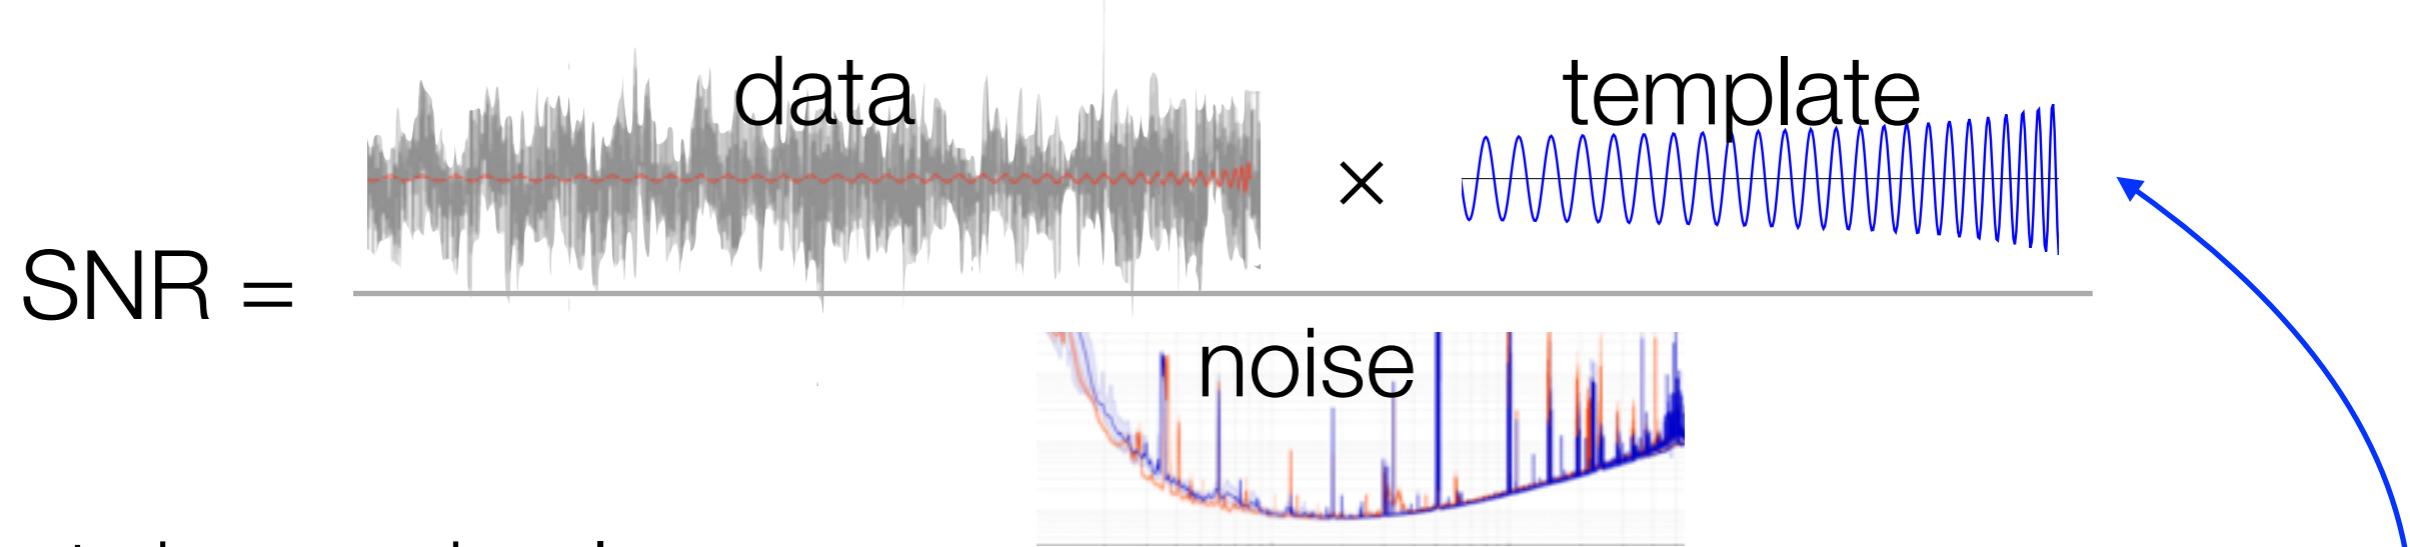

NSBH expected  $0.2 - 300 \text{ yr}^{-1}$

LSC/Virgo [1003.2480](#)

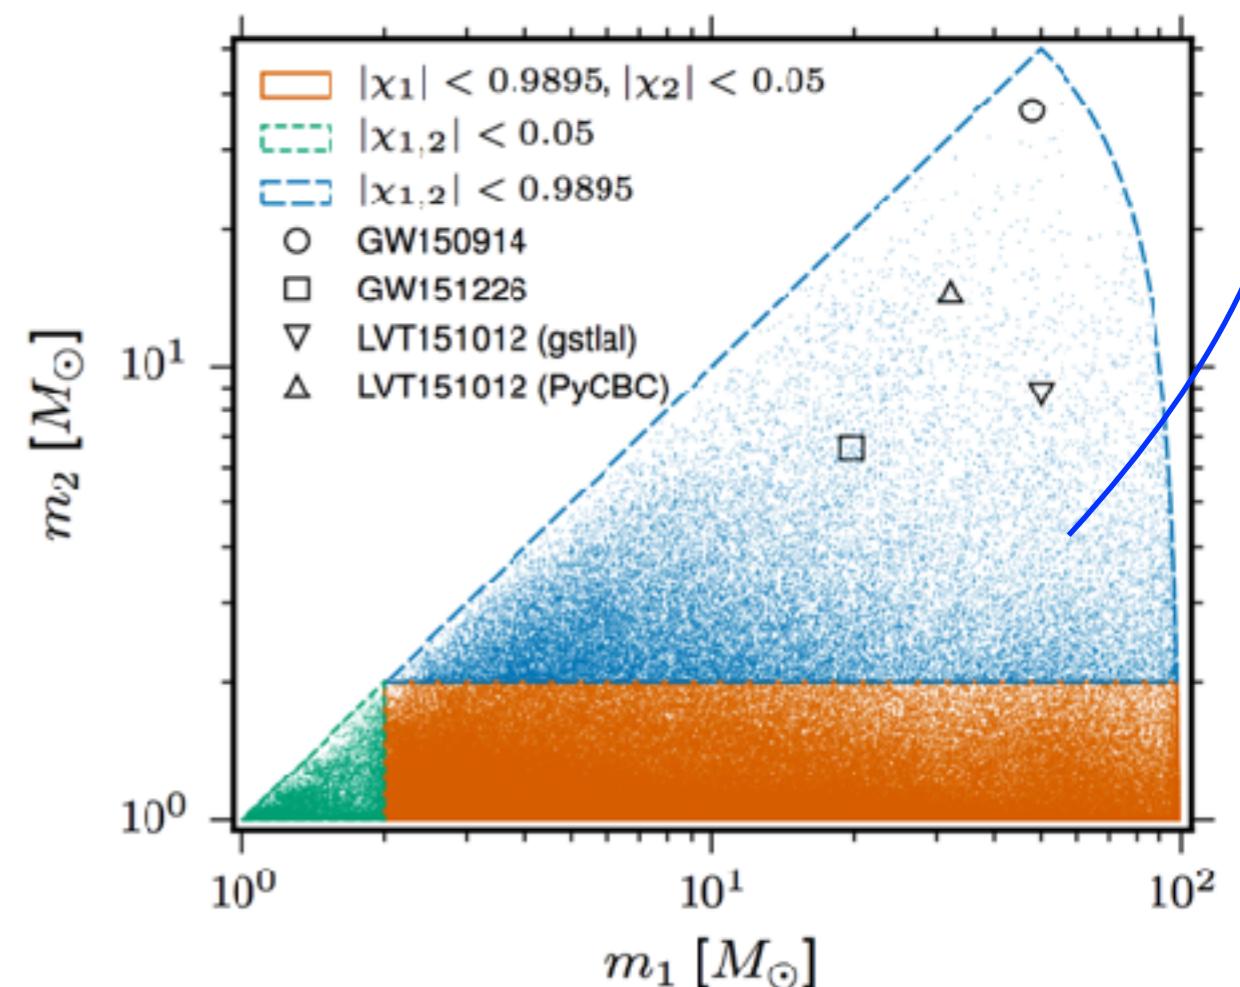

BBH expected  $9 - 240 \text{ Gpc}^{-3} \text{ yr}^{-1}$

LSC/Virgo [1606.04856](#)

# Matched-filter search for compact binary mergers

- Integrate known signal predictions against data over many cycles, for coincident time and parameters
  - $\chi^2$ -weighted SNR, time slide background estimate
  - Estimate relative likelihood of noise and signal, single detector background estimate

# First observing run (O1) from Sept 18 2015 to Jan 12 2016

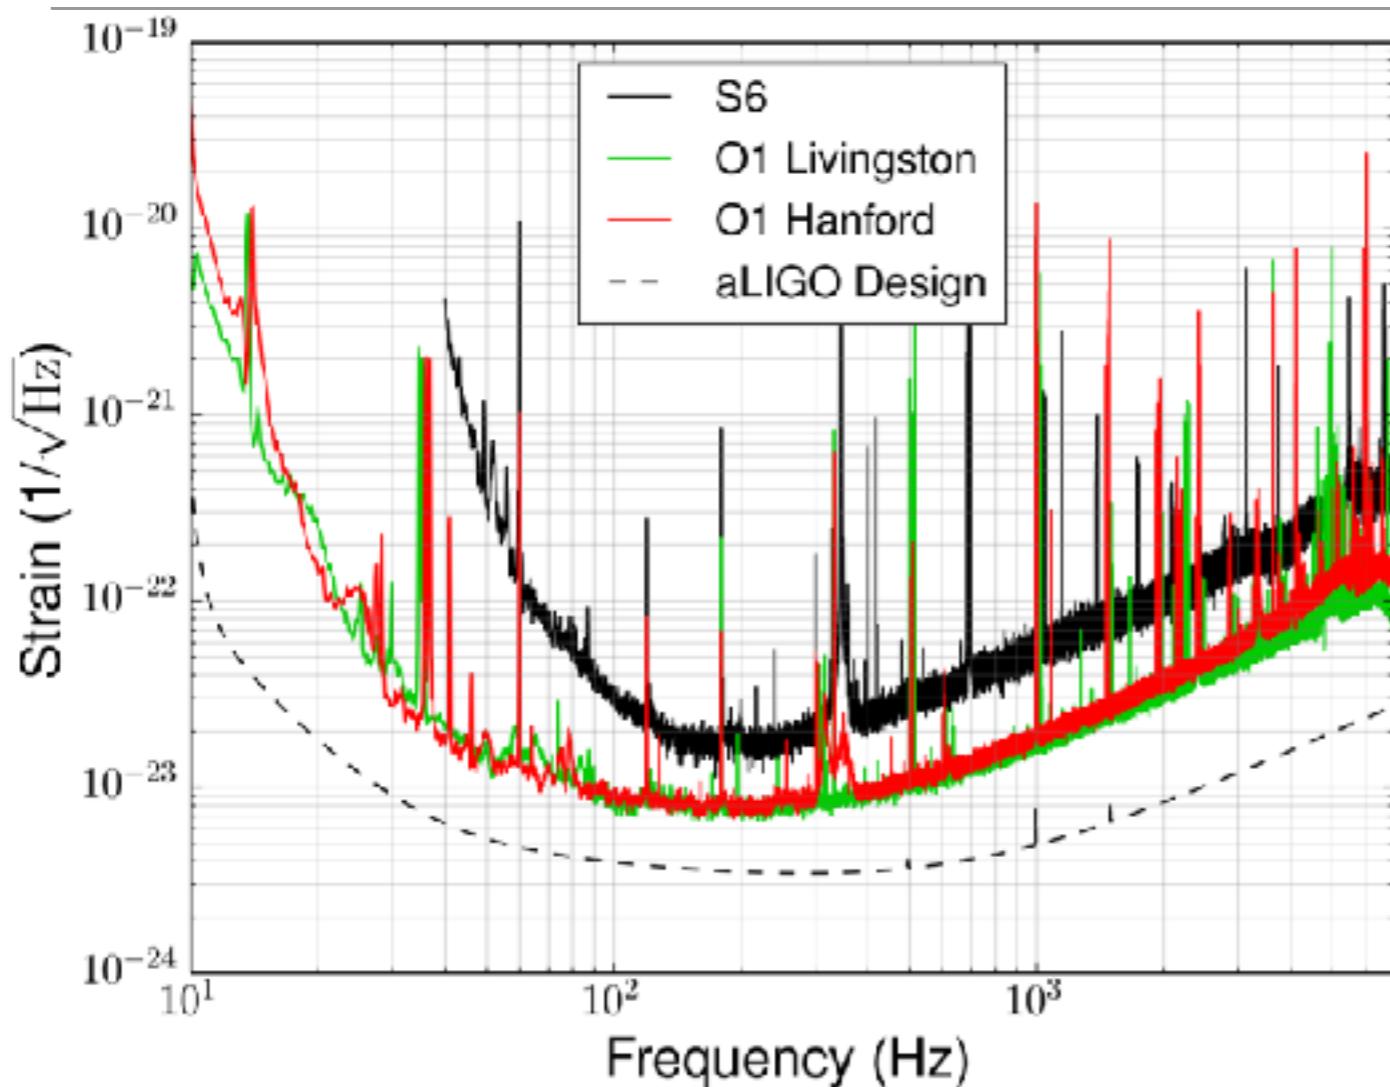

Figure by C. Messick

<https://dcc.ligo.org/LIGO-G1500623/public> ,  
<https://dcc.ligo.org/LIGO-T1100338/public>

- 49 days coincident data
- ~70 Mpc reach for BNS
- No detections (or significant candidate detections) have low-mass components
- Upper limits on the rates of BNS and NSBH mergers
- <https://arxiv.org/abs/1607.07456>

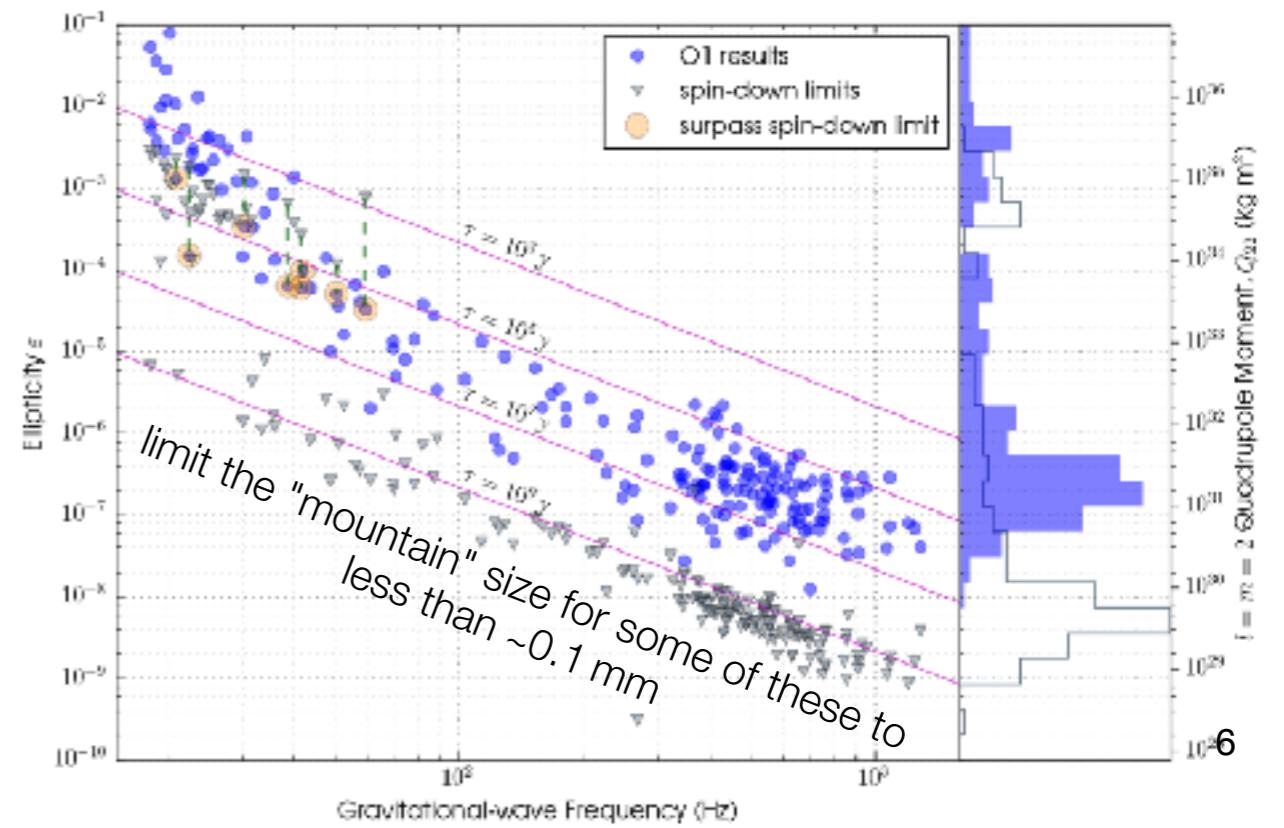

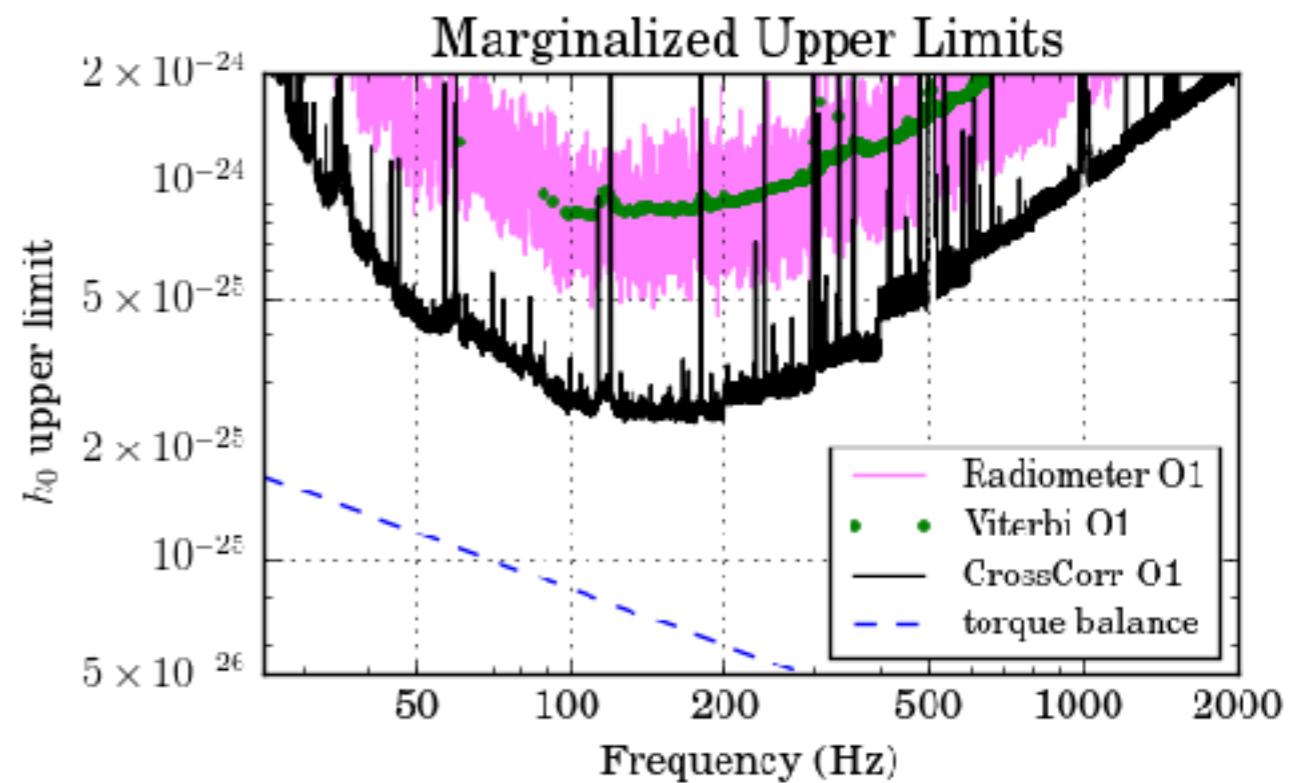

# Neutron stars as continuous-wave sources: O1 upper limits

Upper Limits on Gravitational  
Waves from Scorpius X-1 [...]  
in Advanced LIGO Data

LSC/Virgo arXiv:1706.03119

First search for gravitational  
waves from known pulsars  
with Advanced LIGO

LSC/Virgo arXiv:1701.07709

# An unexpected lack of merging neutron stars?

---

Saltpeter initial mass function  
for BH vs NS progenitor star

$$\frac{N(M > 80M_{\odot})}{N(M > 10M_{\odot})} = \left(\frac{80M_{\odot}}{10M_{\odot}}\right)^{-1.35} \simeq 0.06.$$

Assume roughly the same  
ratio of merger rates

$$\frac{\mathcal{R}_{BH}}{\mathcal{R}_{NS}} = \left(\frac{80M_{\odot}}{10M_{\odot}}\right)^{-1.35} \simeq 0.06.$$

SNR scales with  $\mathcal{M}^{5/6}$ ;  
detection volume  $\sim \text{SNR}^3$

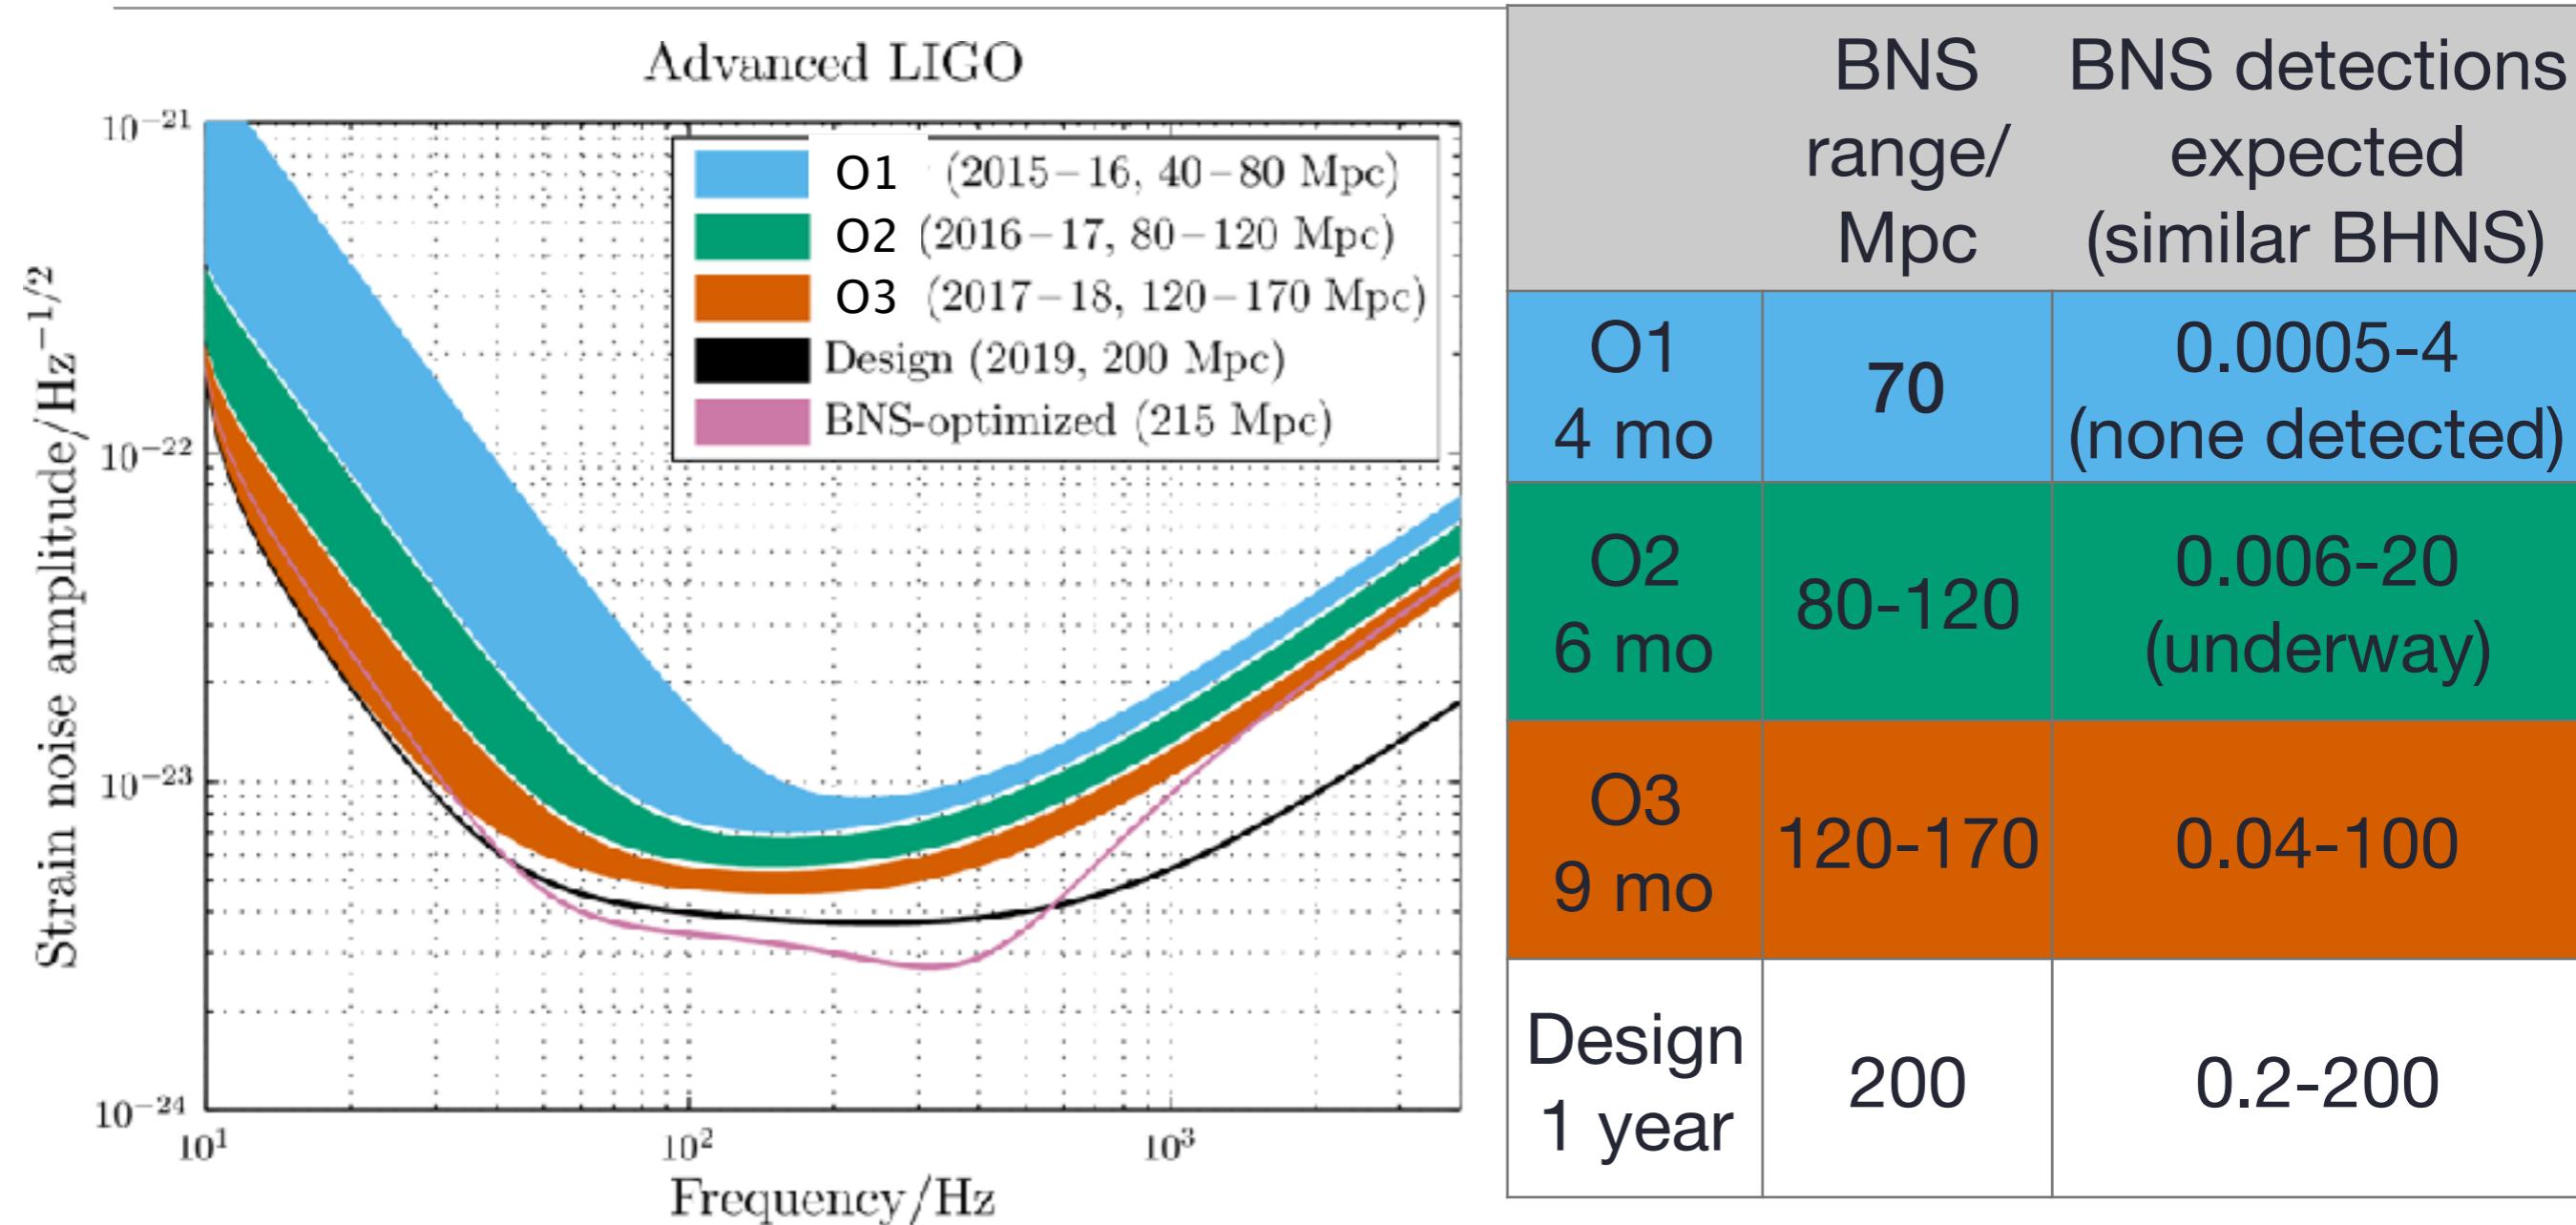

$$\frac{\mathcal{D}_{BH}}{\mathcal{D}_{NS}} = \frac{\mathcal{R}_{BH}}{\mathcal{R}_{NS}} \left(\frac{\mathcal{M}_{BH}}{\mathcal{M}_{NS}}\right)^{5/2}$$

$$\frac{\mathcal{D}_{BH}}{\mathcal{D}_{NS}} = \left(\frac{80M_{\odot}}{10M_{\odot}}\right)^{-1.35} \left(\frac{8.5M_{\odot}}{1.40M_{\odot}}\right)^{5/2} \simeq 5.5.$$

# O1 rate constraints and future expectations: binary neutron star mergers

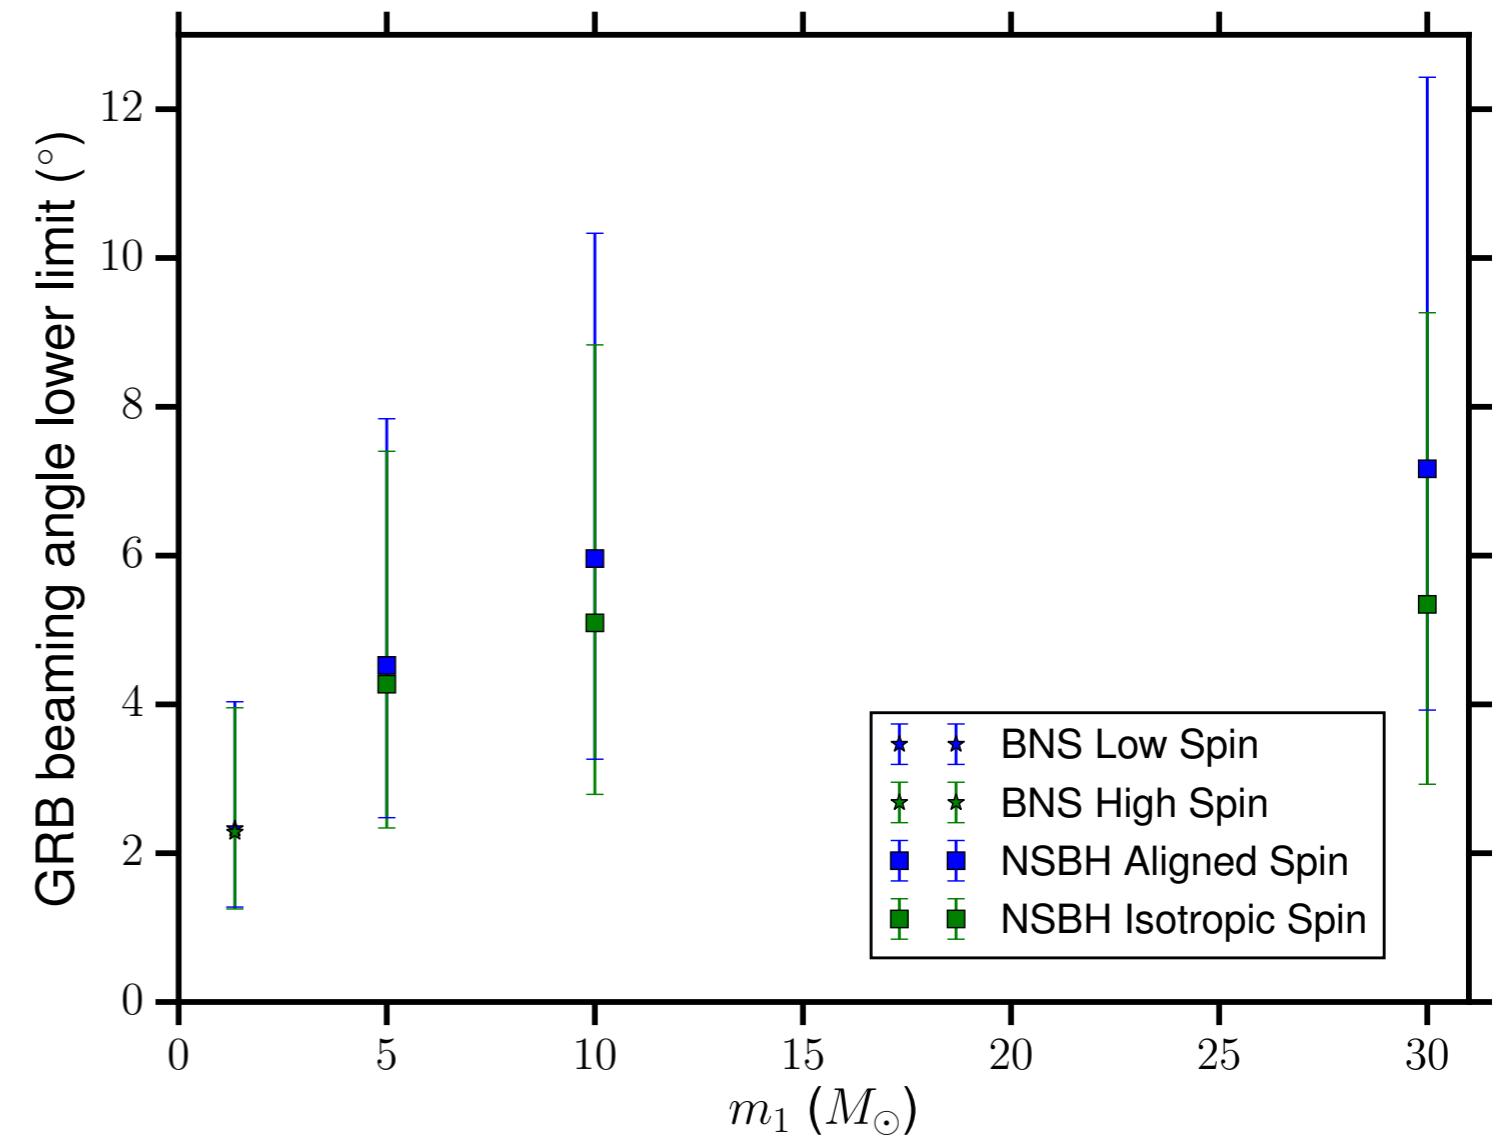

# O1 rate constraints and future expectations: neutron-star/black-hole mergers

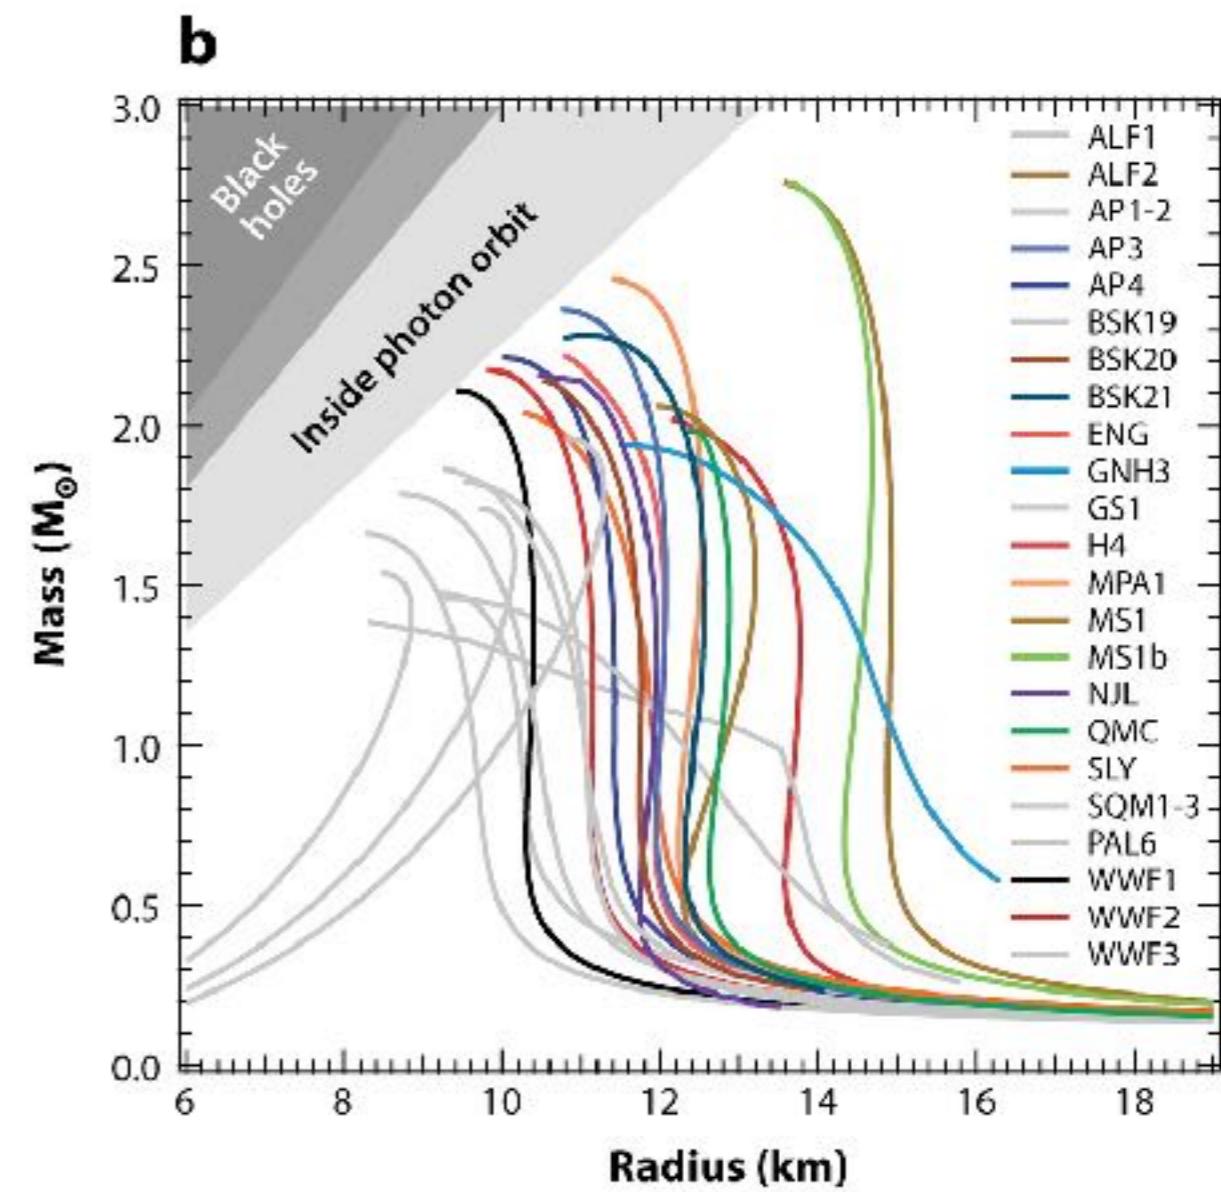

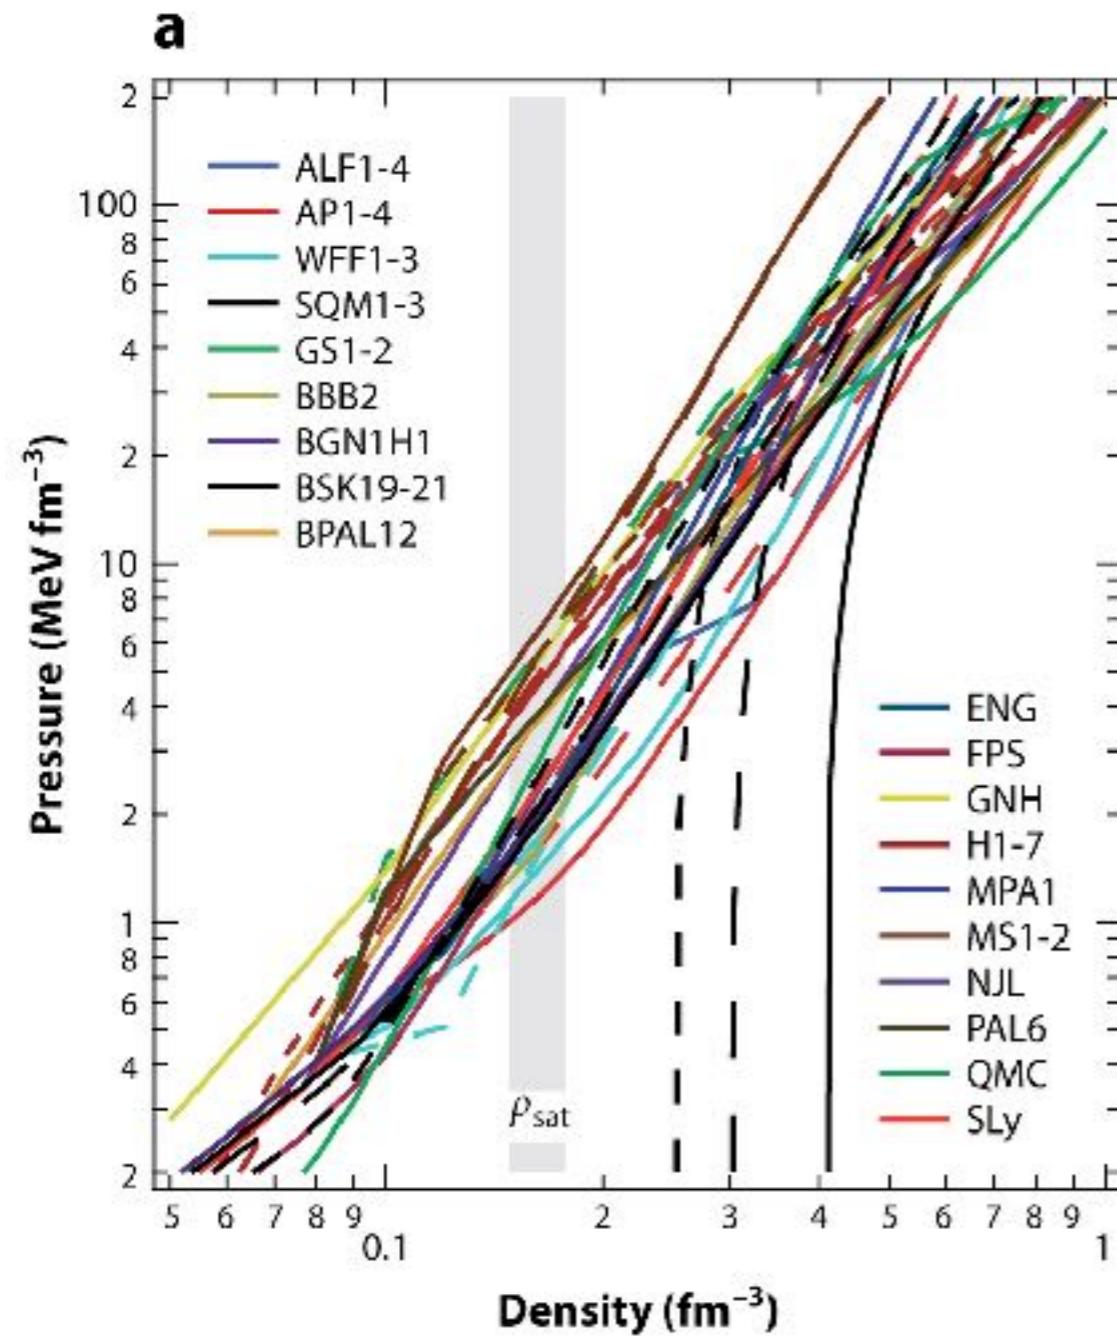

# Advanced LIGO upper limits vs sGRB rates: gamma-ray burst beaming angle limit

- Short GRB observed rate is  $10^{+20}_{-7} \text{ Gpc}^{-3} \text{ yr}^{-1}$
- Derive lower limit on beaming angles for a fixed class of progenitors using LIGO's 90% upper rate limits
- Beaming angle observations  $\sim 3\text{--}25^\circ$

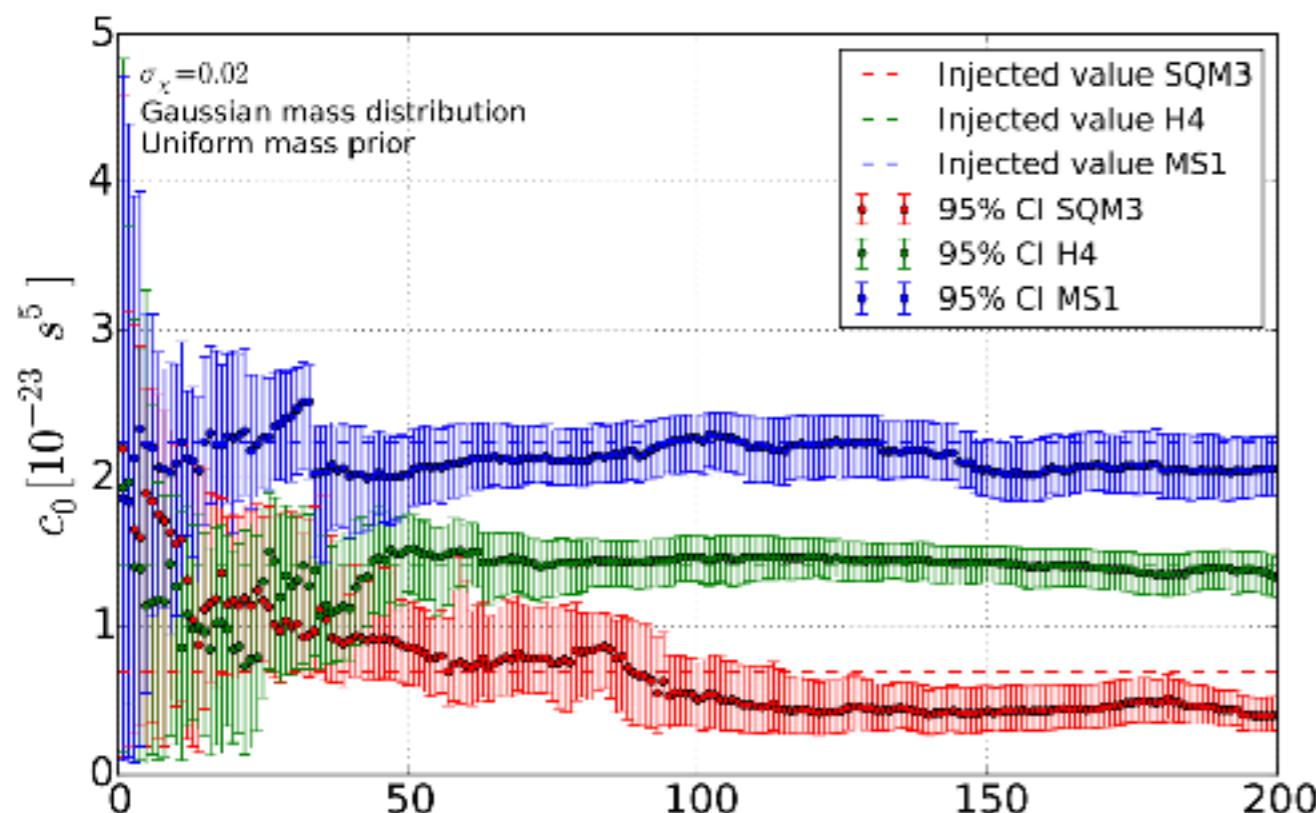

# Neutron-star matter

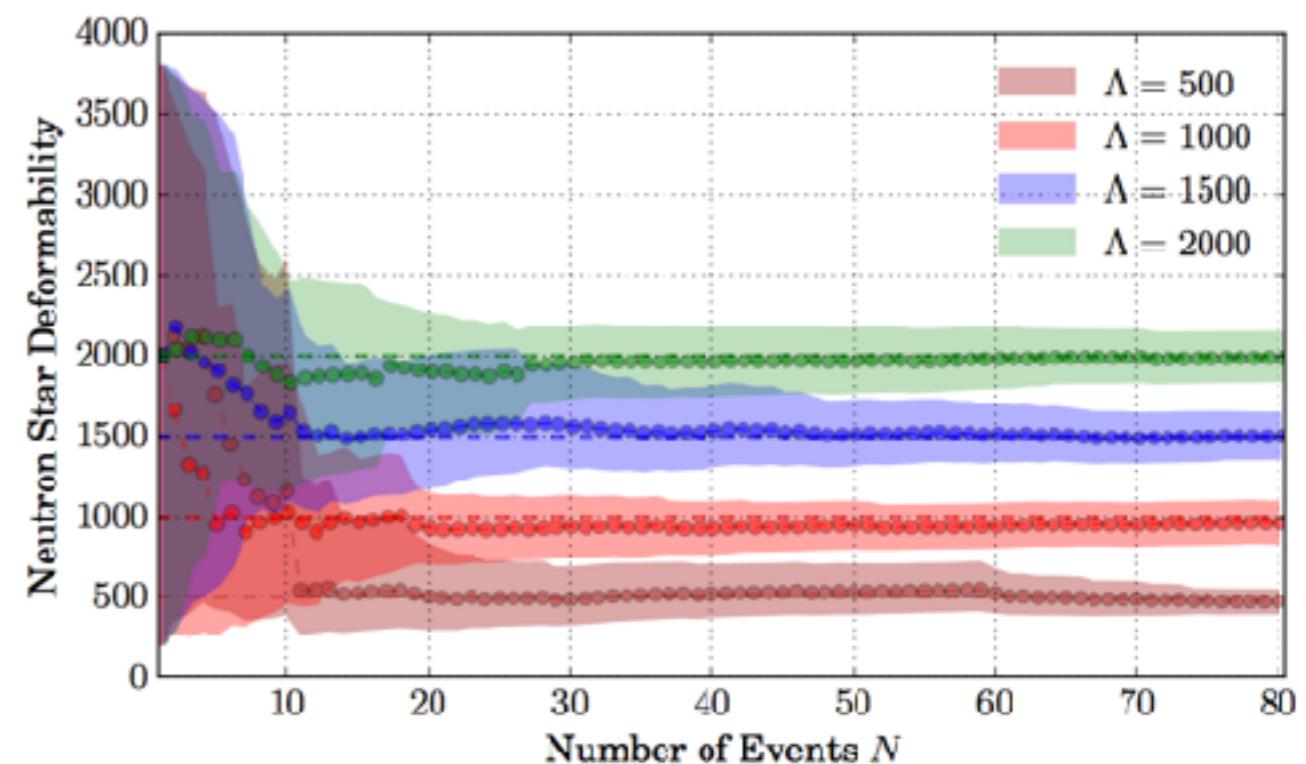

# Learning about neutron-star matter from a population of GW signals

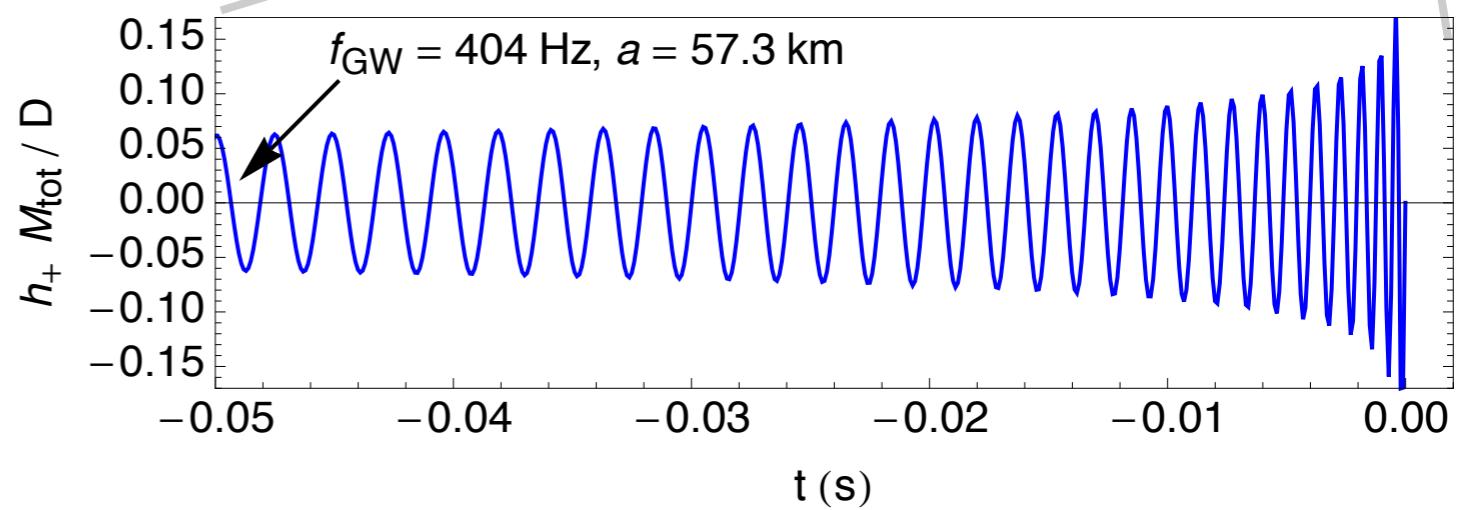

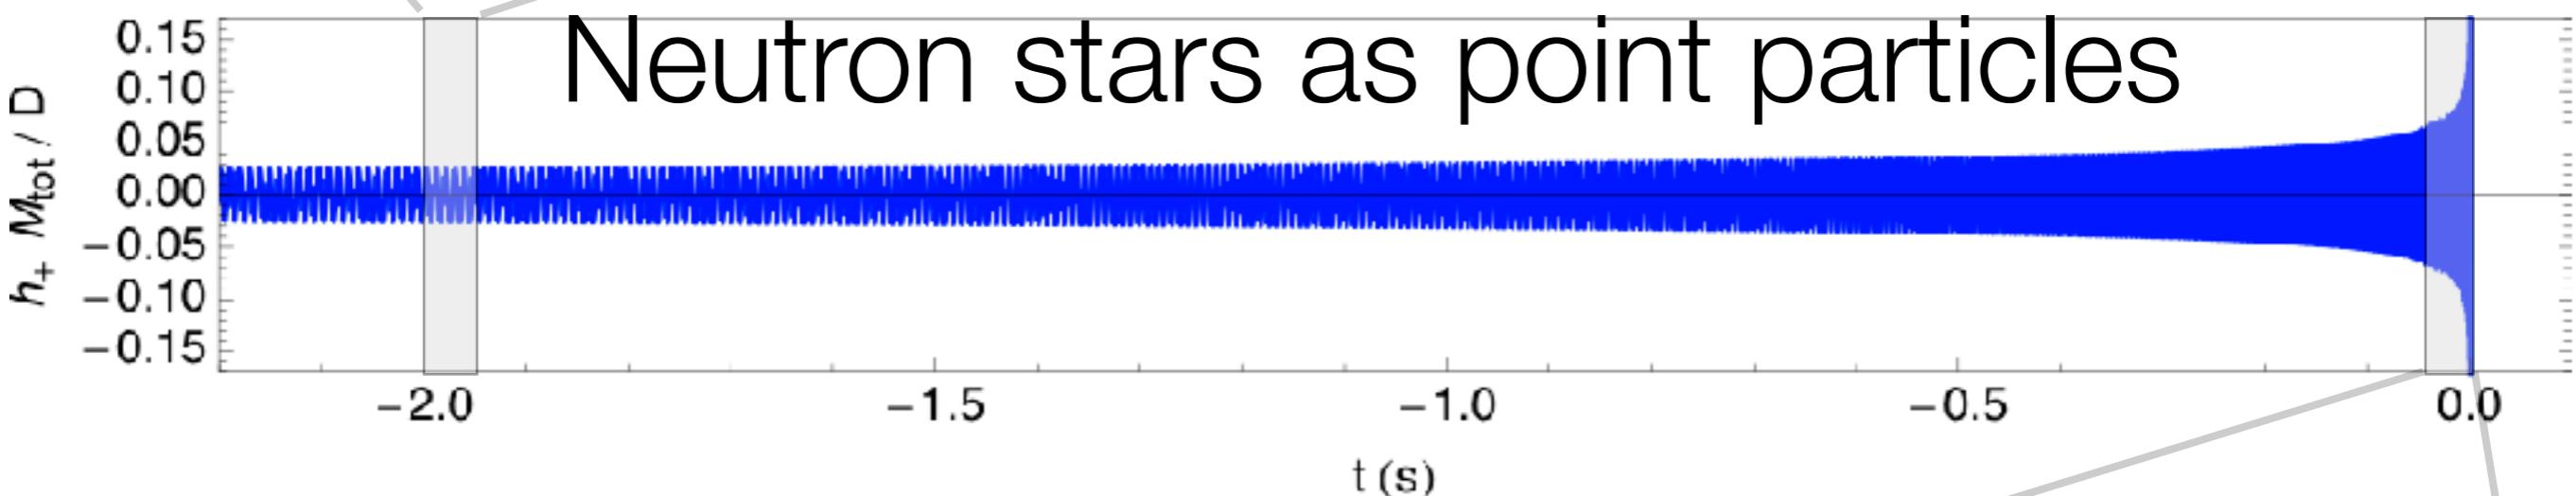

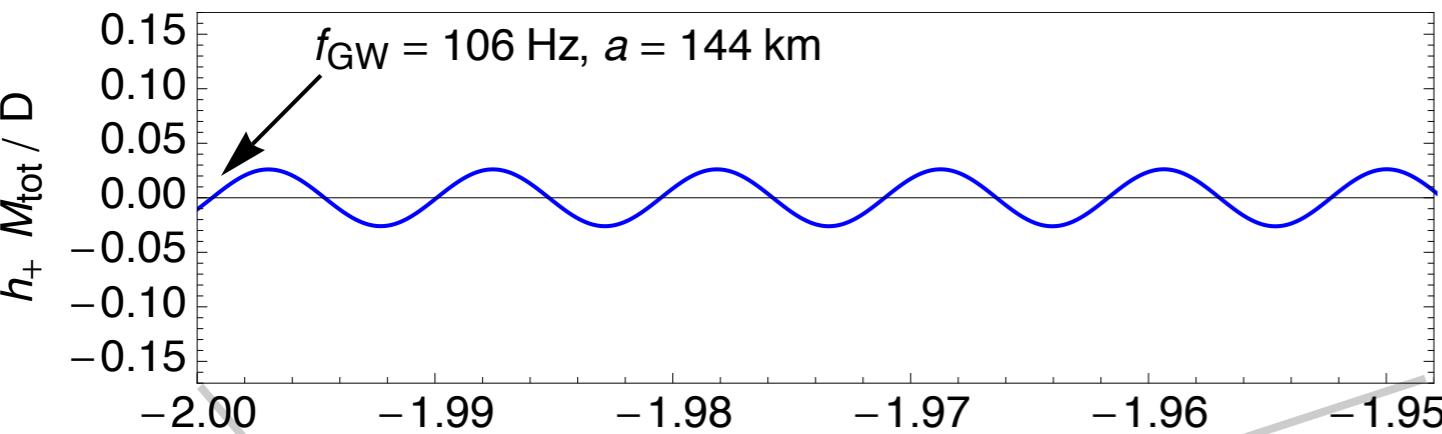

- Neutron-star mergers, or *disruptive* black-hole/neutron-star mergers: “Interesting” with ~tens of detections
- Relies on accurate waveform modeling!

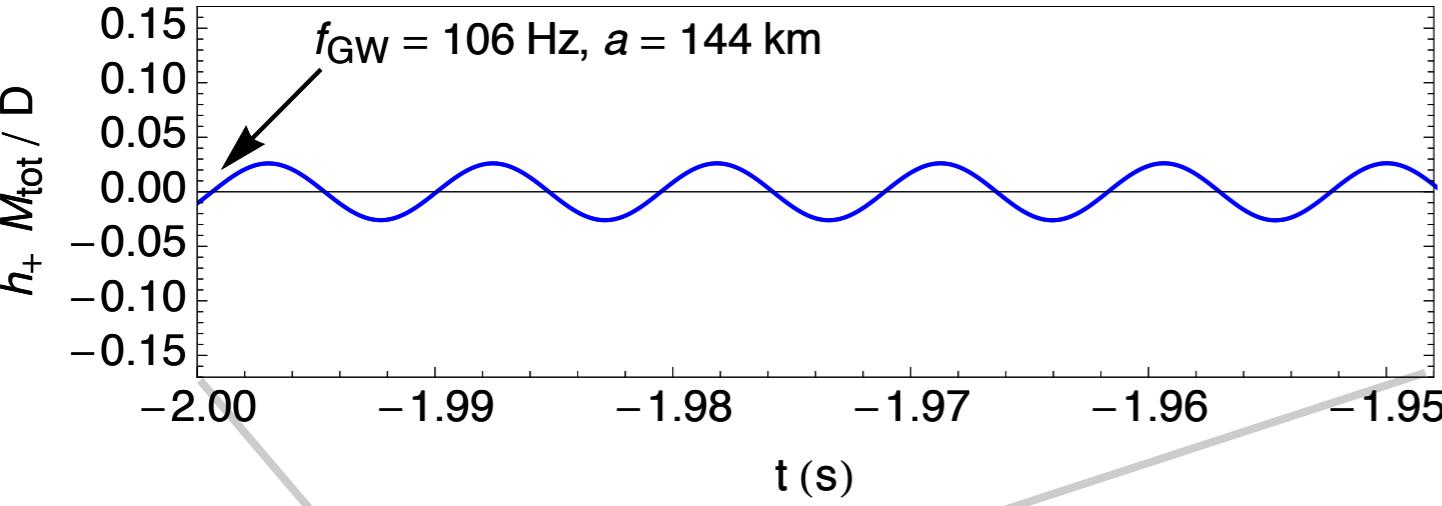

Agathos et al  
arXiv:1503.05405

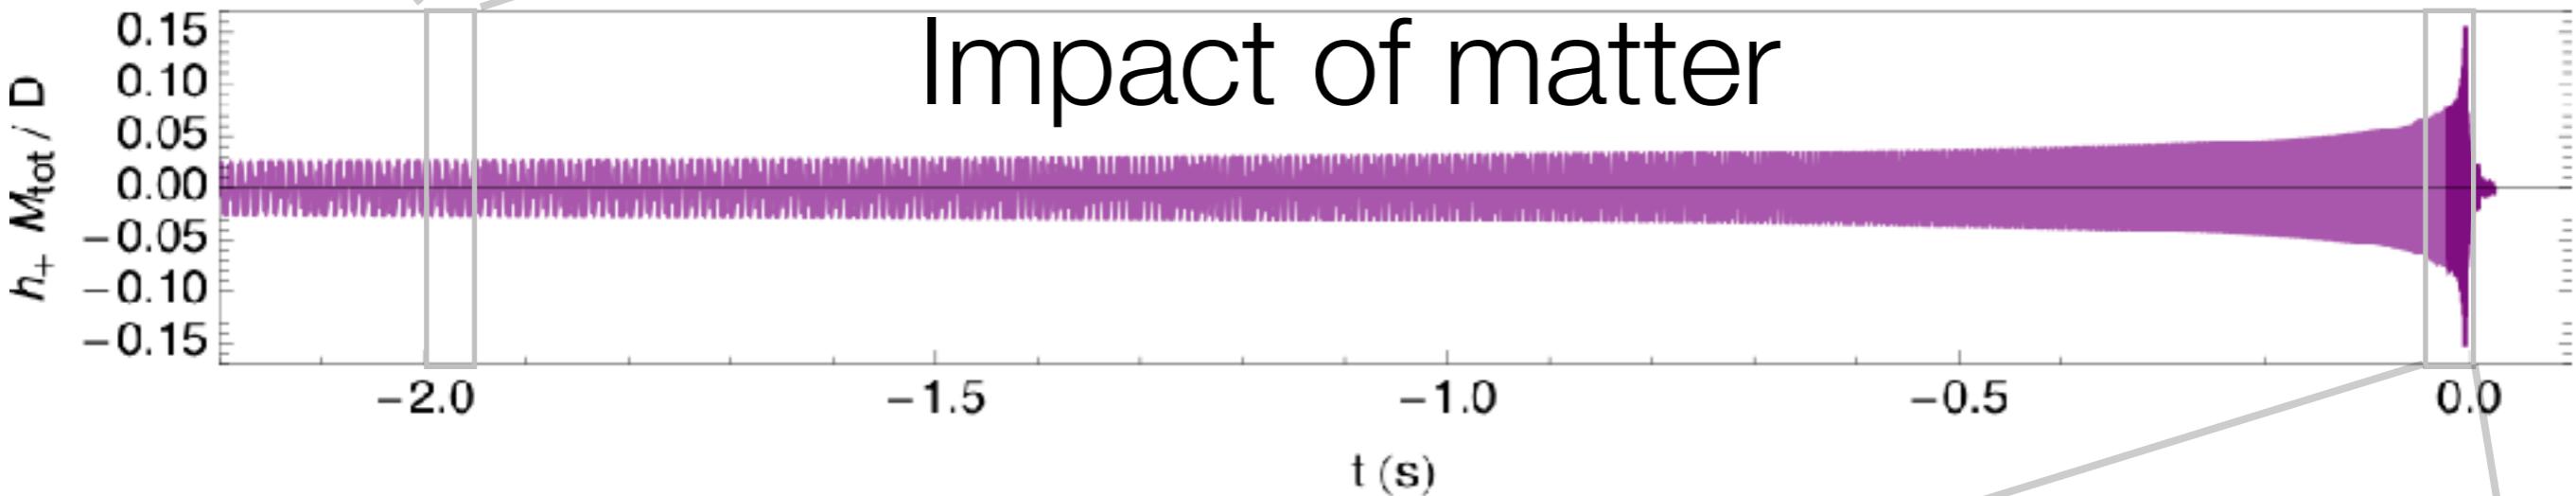

Kumar, Pürer, Pfeiffer  
arXiv:1610.06155

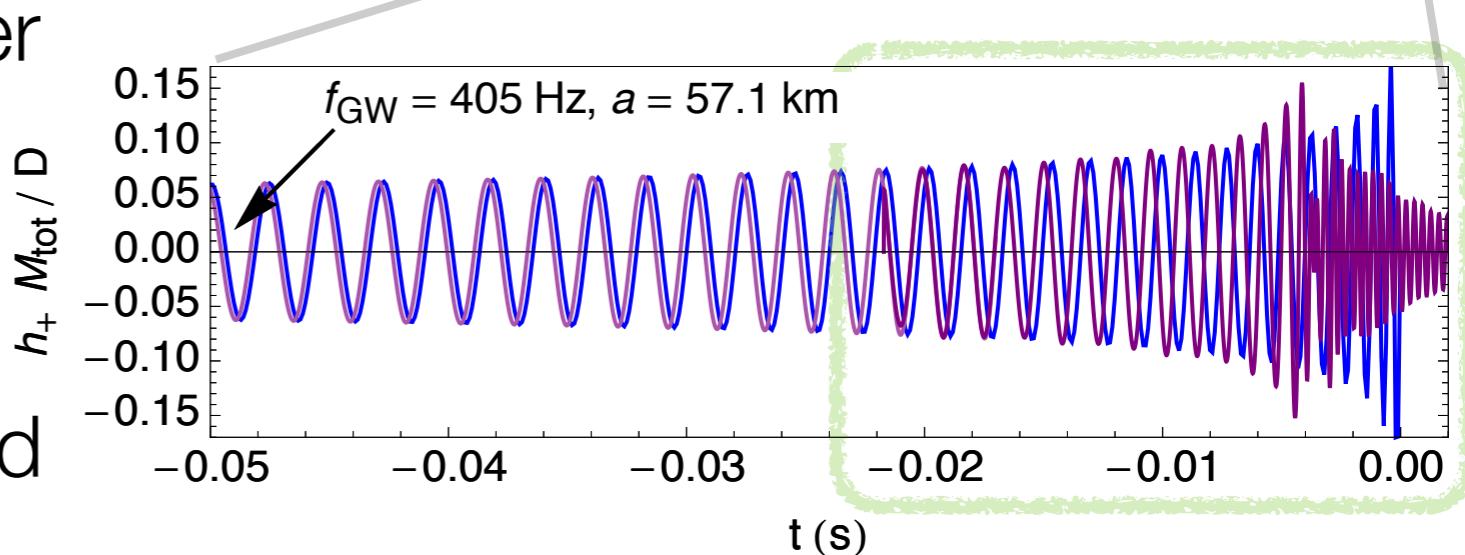

Hard to modify inspiral:  
transfer of  $\sim 10^{46} \text{ erg}$  at  
 $\sim 100 \text{ Hz}$  modifies phase  
by  $10^{-3}$  radians (Crust  
shattering, Tsang et al  
1110.0467)

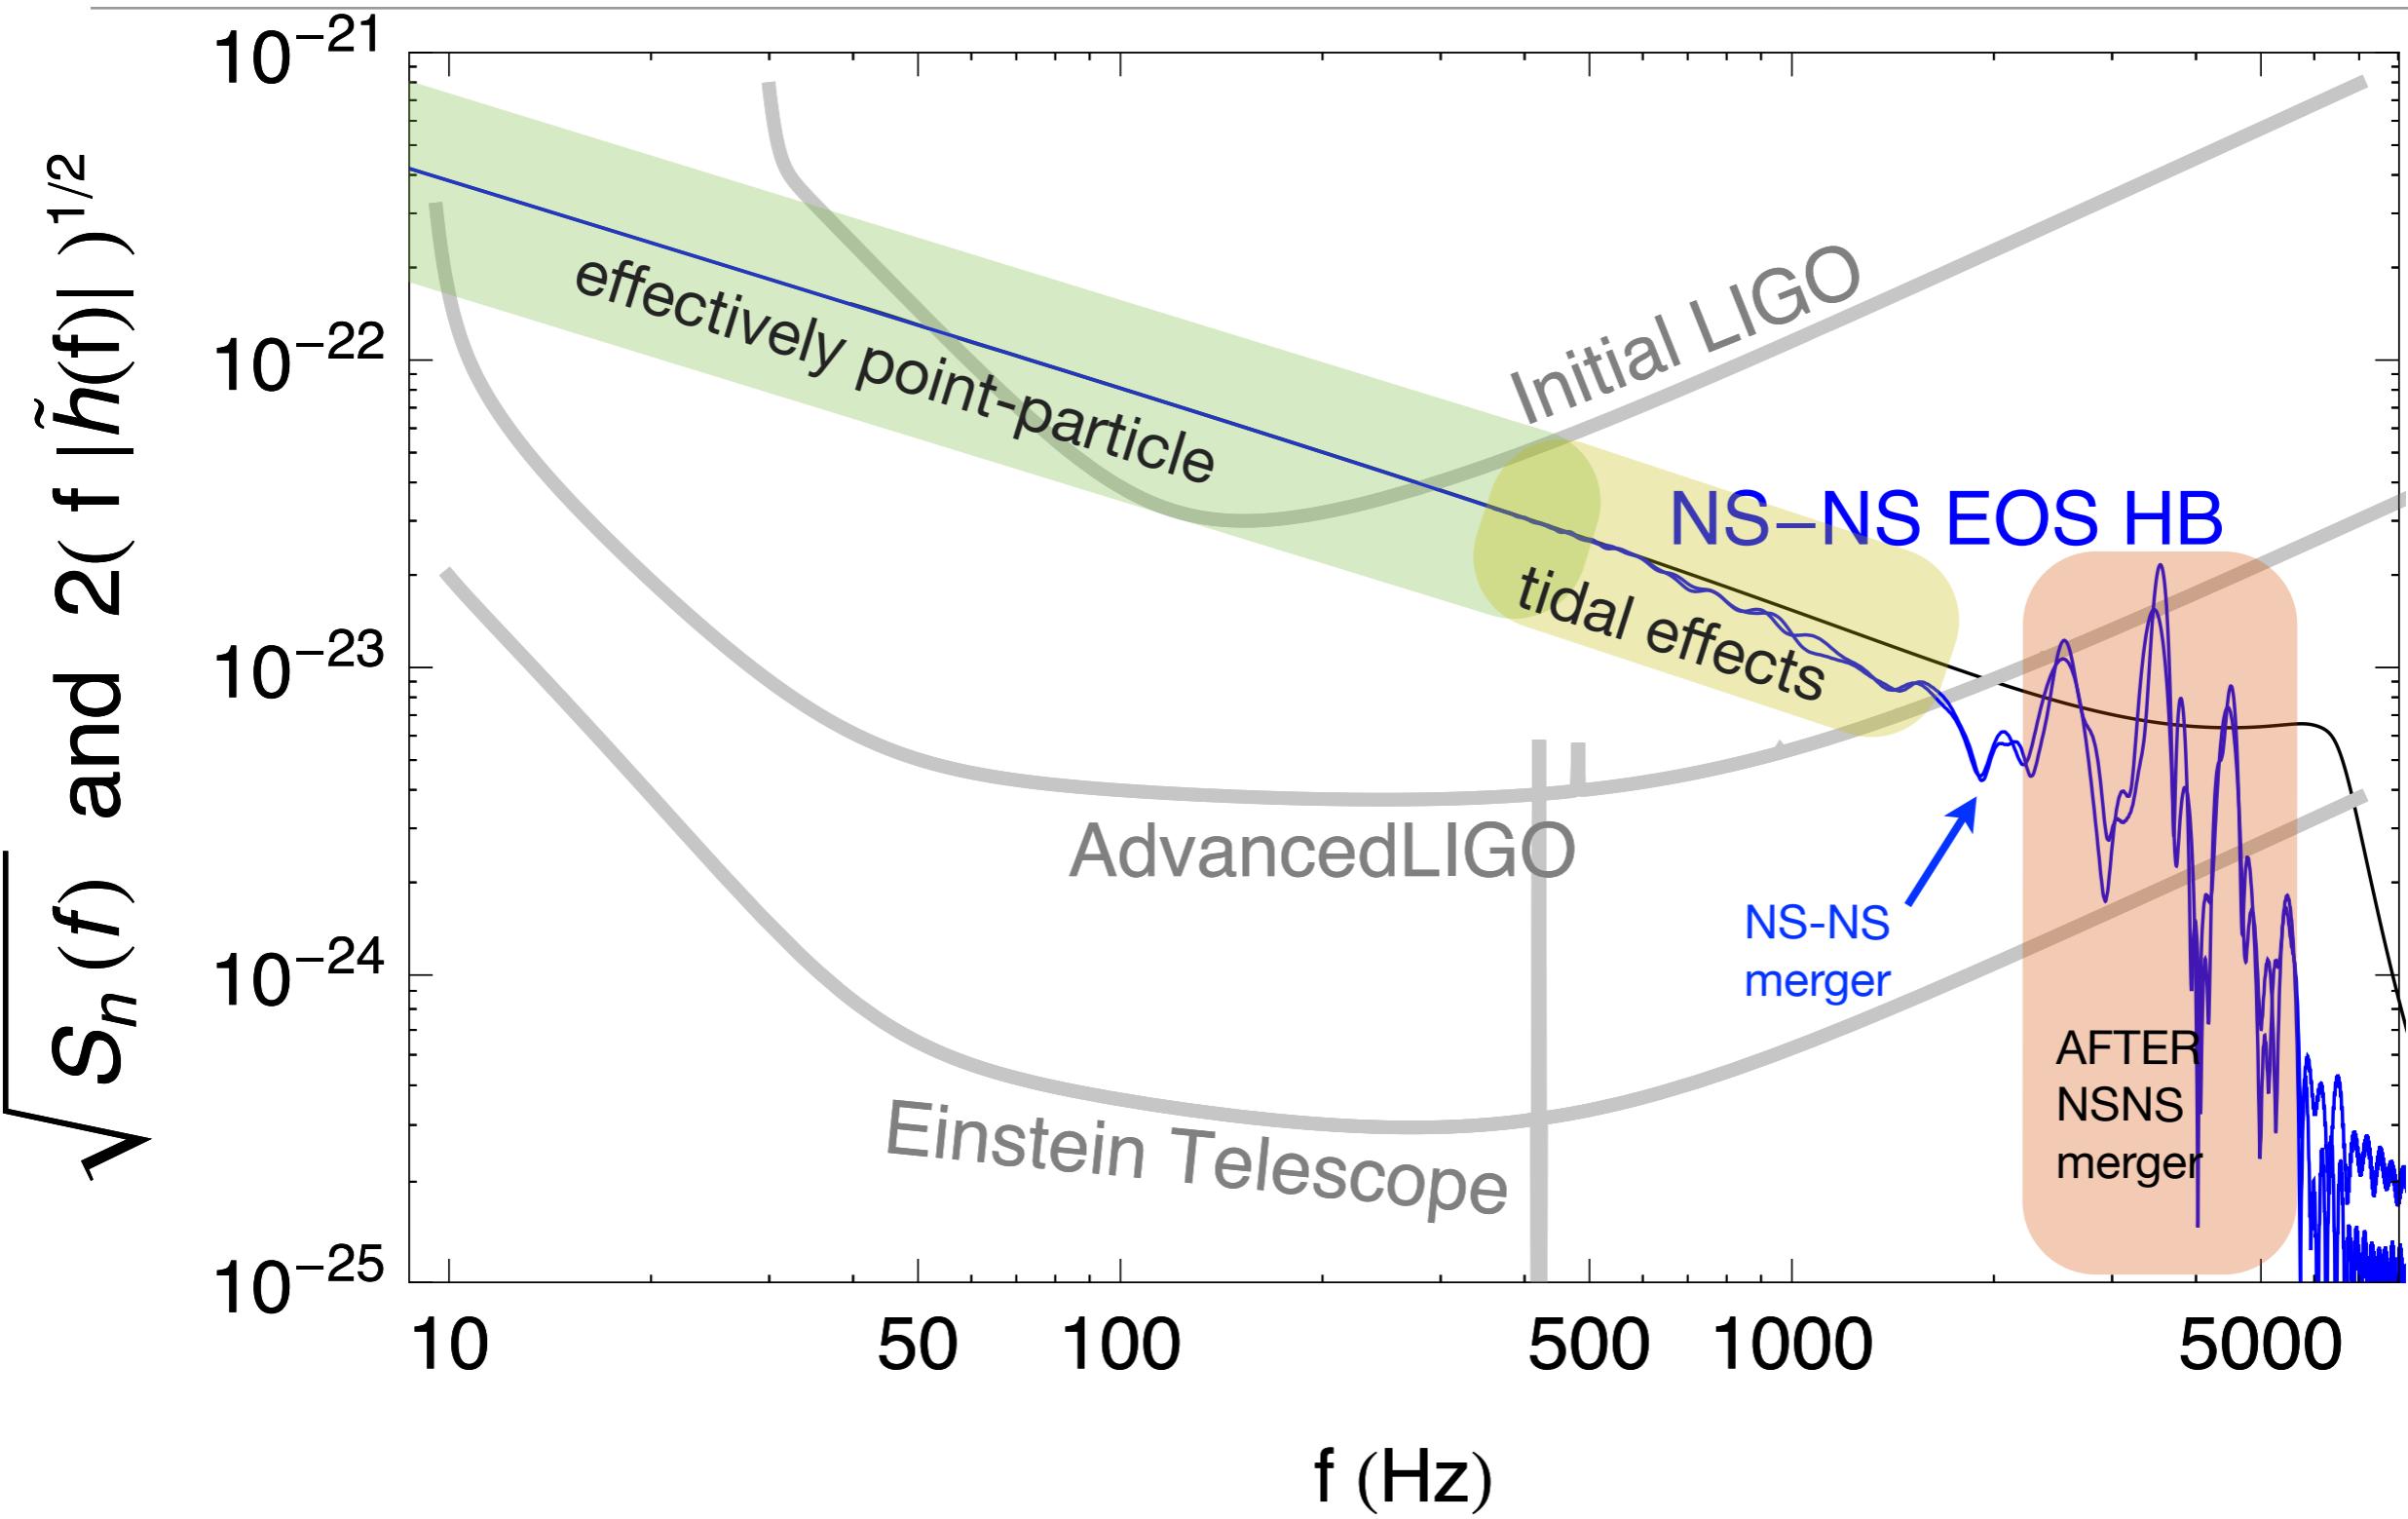

Tidal interactions lead to  
accumulated phase shift at higher  
frequencies.

For the final coalescence,  
numerical simulations are required

# Gravitational-wave spectrum of BNS

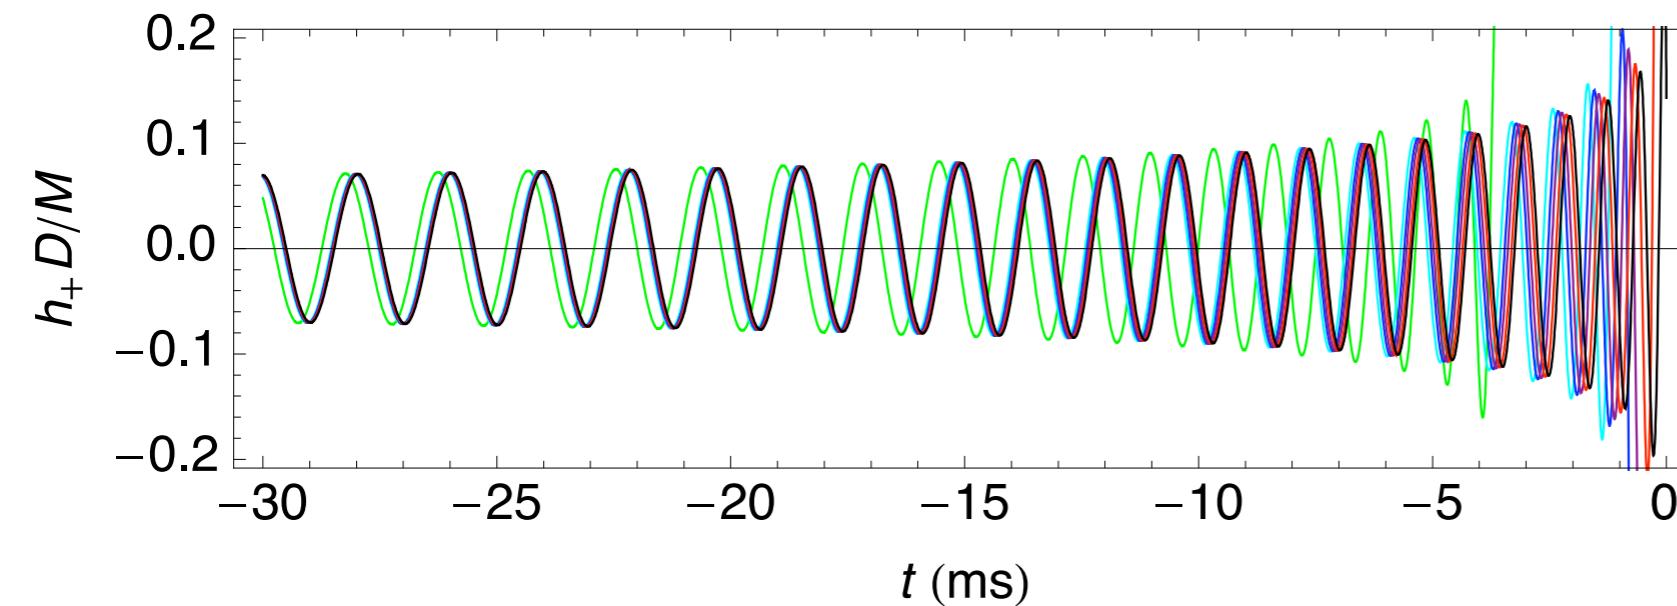

# Tidal effects on inspiral

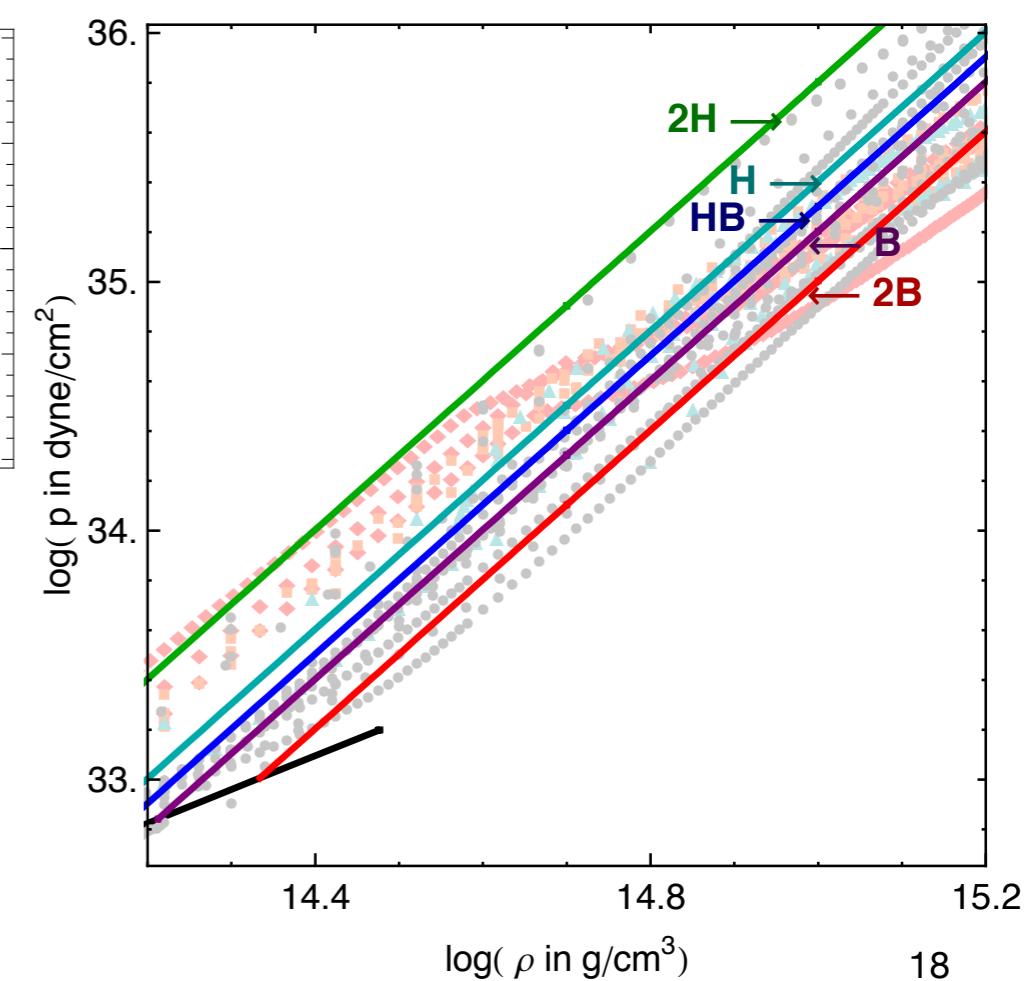

Haas et al arXiv:1604.00782

- Energy goes into deforming the neutron star(s), tidal bulges add a bit to the gravitational radiation.
- Modify GW at effectively high post-Newtonian order (Flanagan and Hinderer 0709.1915, Vines and Flanagan 1009.4919)

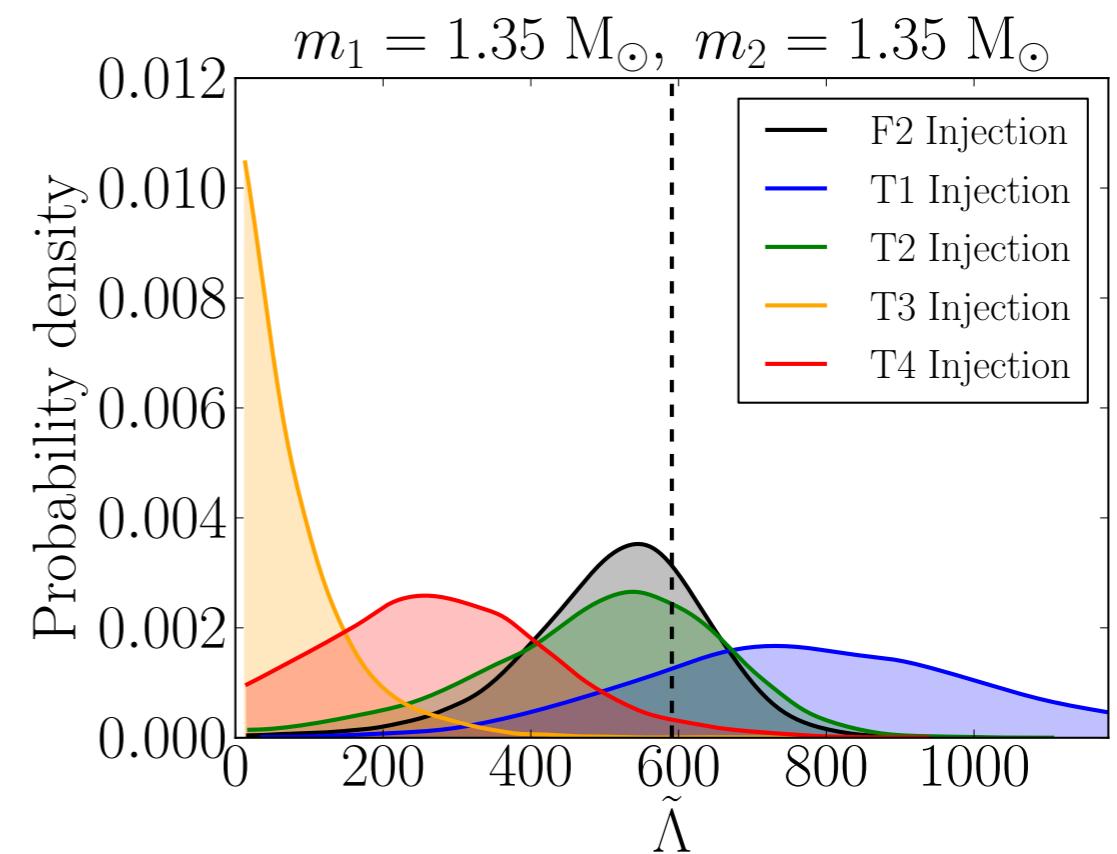

Size of effect on

$$\text{waveform goes as } \Lambda = \frac{2}{3} k_2 \left( \frac{R}{M} \right)^5$$

# Waveform models for parameter estimation: post-Newtonian tides for inspiral?

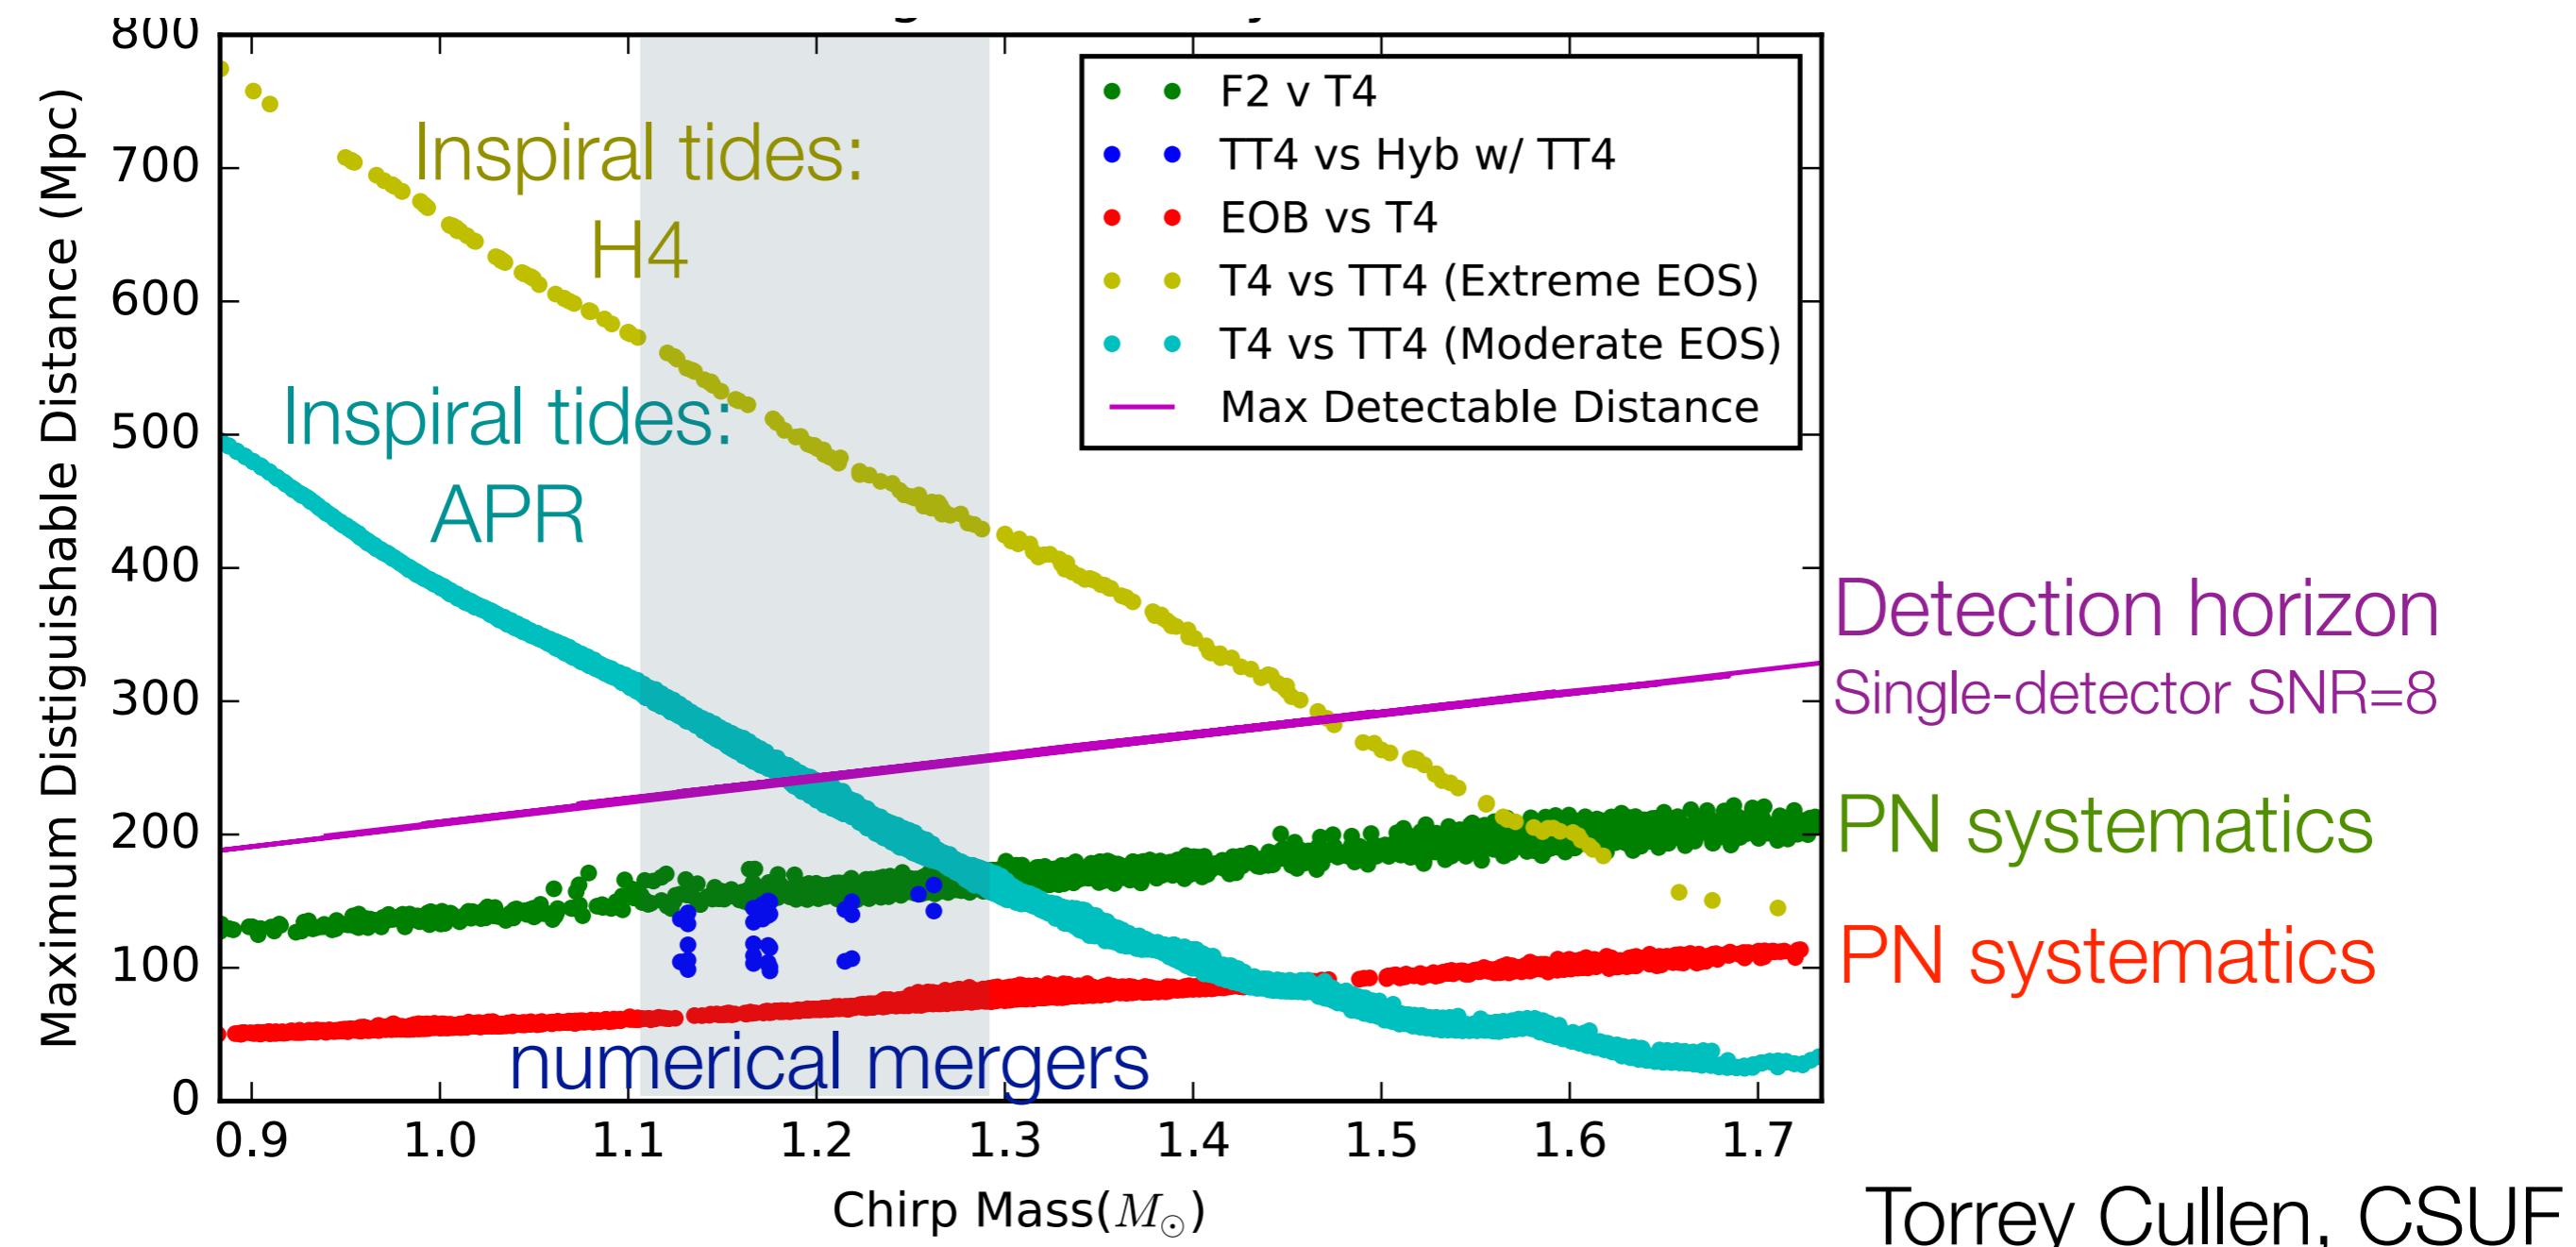

- Good estimates of the size and relevance of EOS-dependent (Damour et al 2012, Read et al 1306.4065)
- **Not** sufficient for best measuring EOS effects (Favata 1310.8288, Yagi/Yunes: 1310.8358, Wade et al.1402.5156)

Wade et al.1402.5156

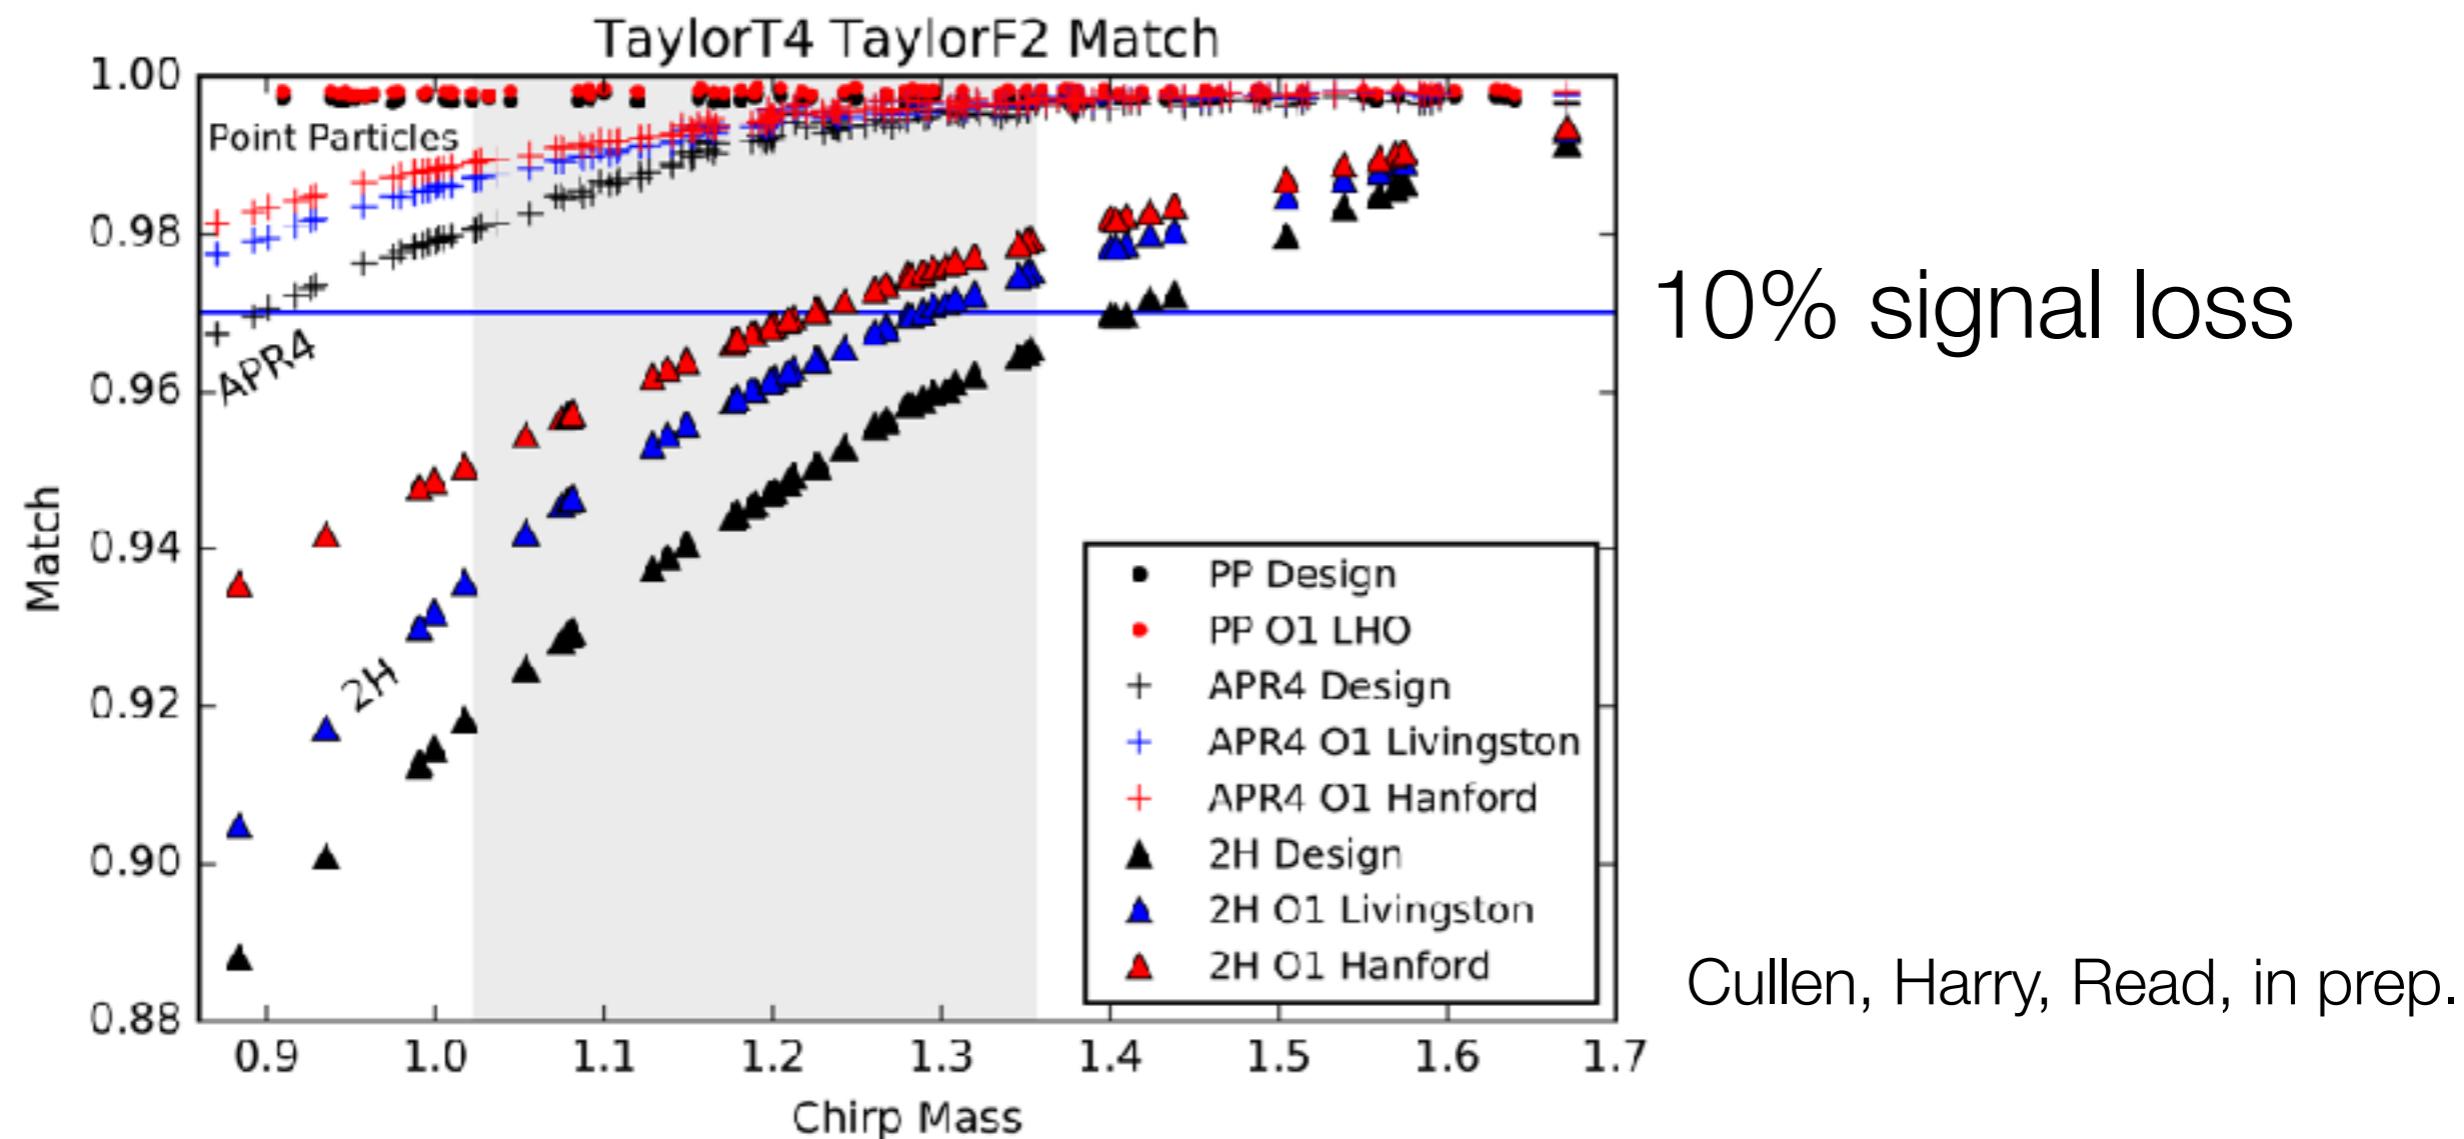

# Relative importance of effects in BNS waveforms

Maximum distinguishable distance: distance at which difference between waveforms has SNR 1

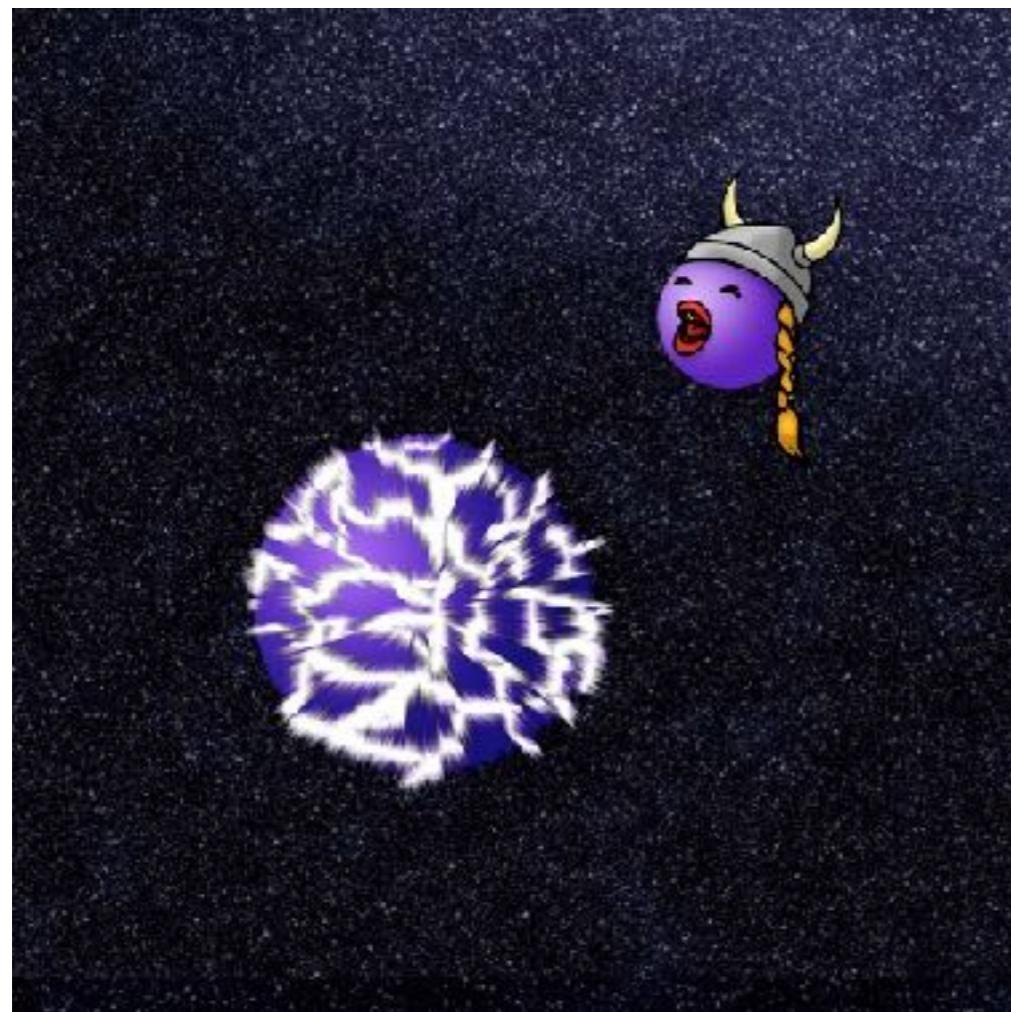

# Matter impacts on search: extreme tides!

- If neutron stars are large, tidal effects induce waveform mismatch & reduce effective search volume

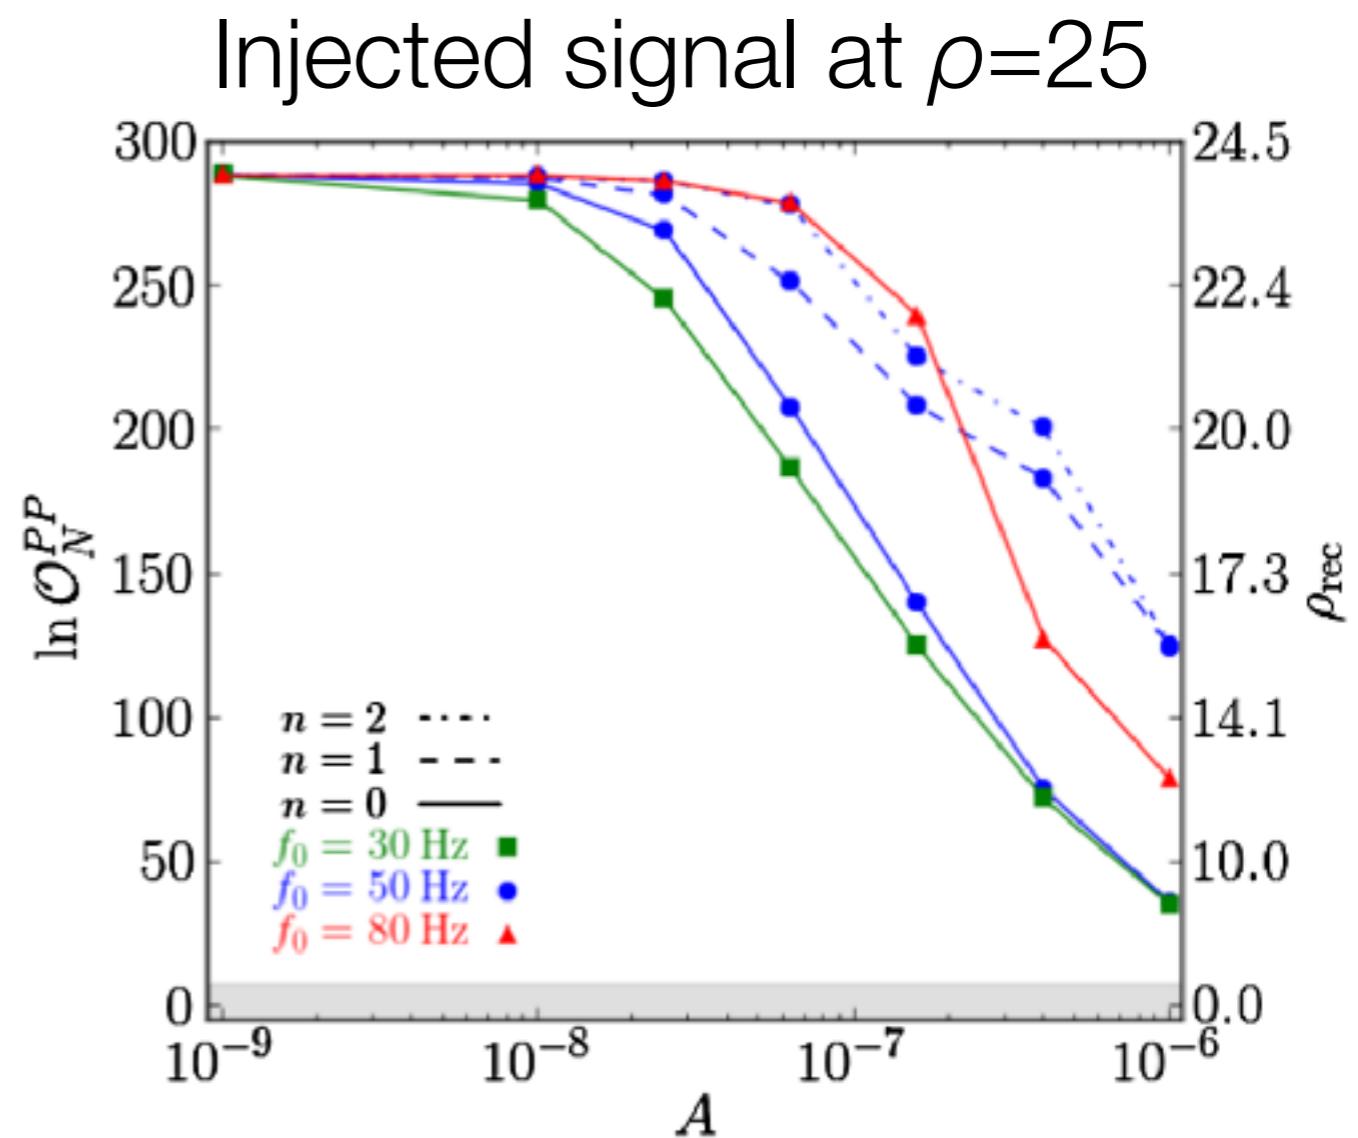

# Matter impacts on search: extreme tides!

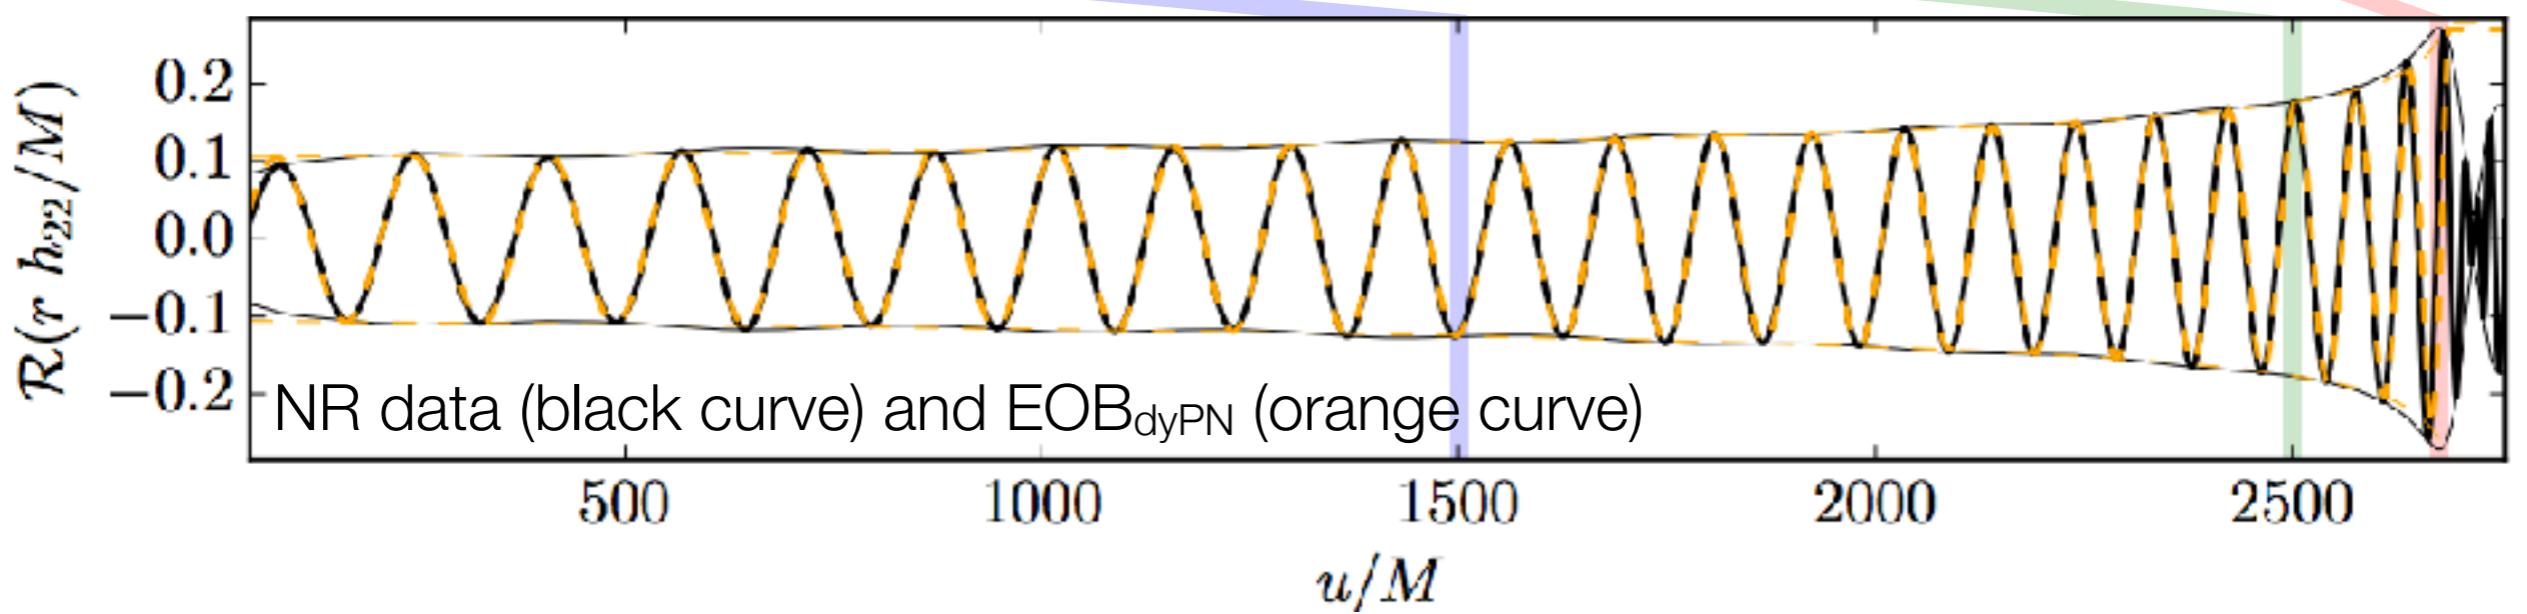

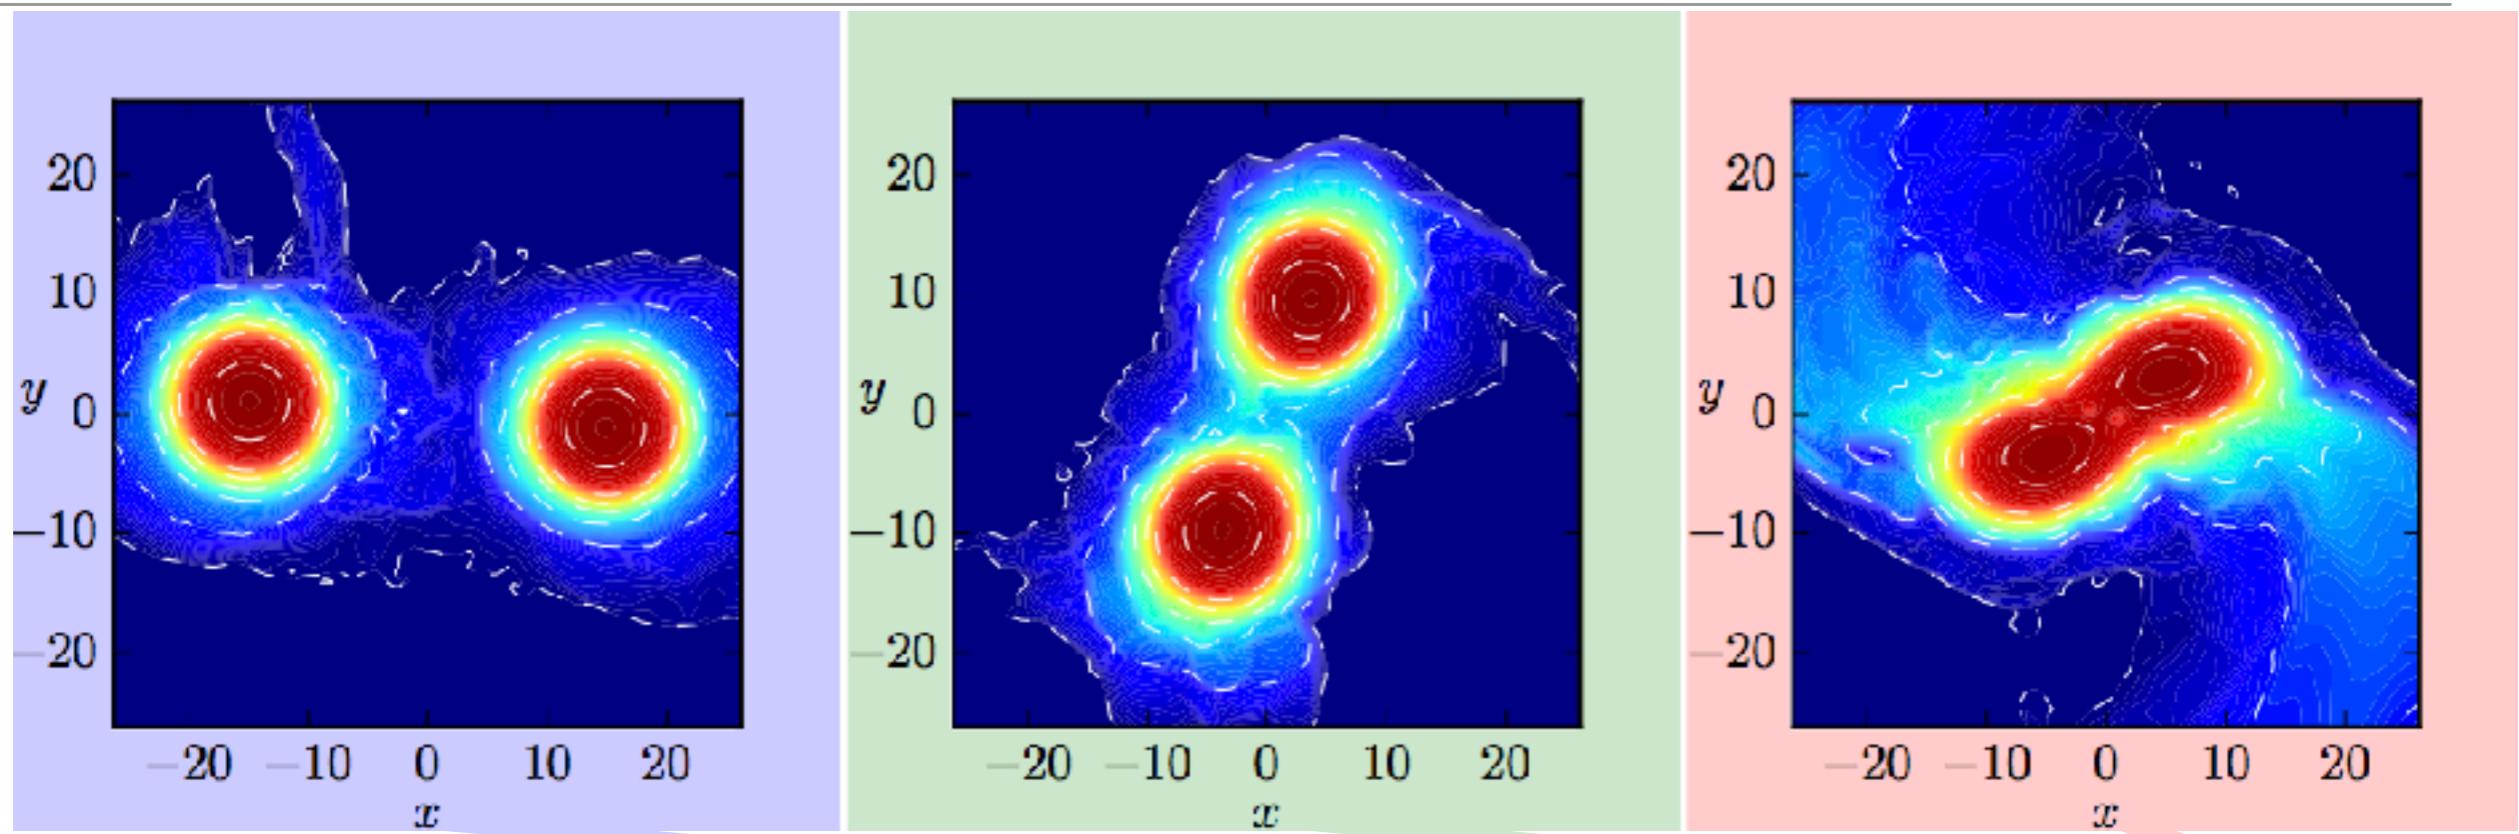

- Instability from nonlinear mode couplings could also disrupt inspiral, search, and parameter estimation (Essick, Vitale, Weinberg 1609.06362)

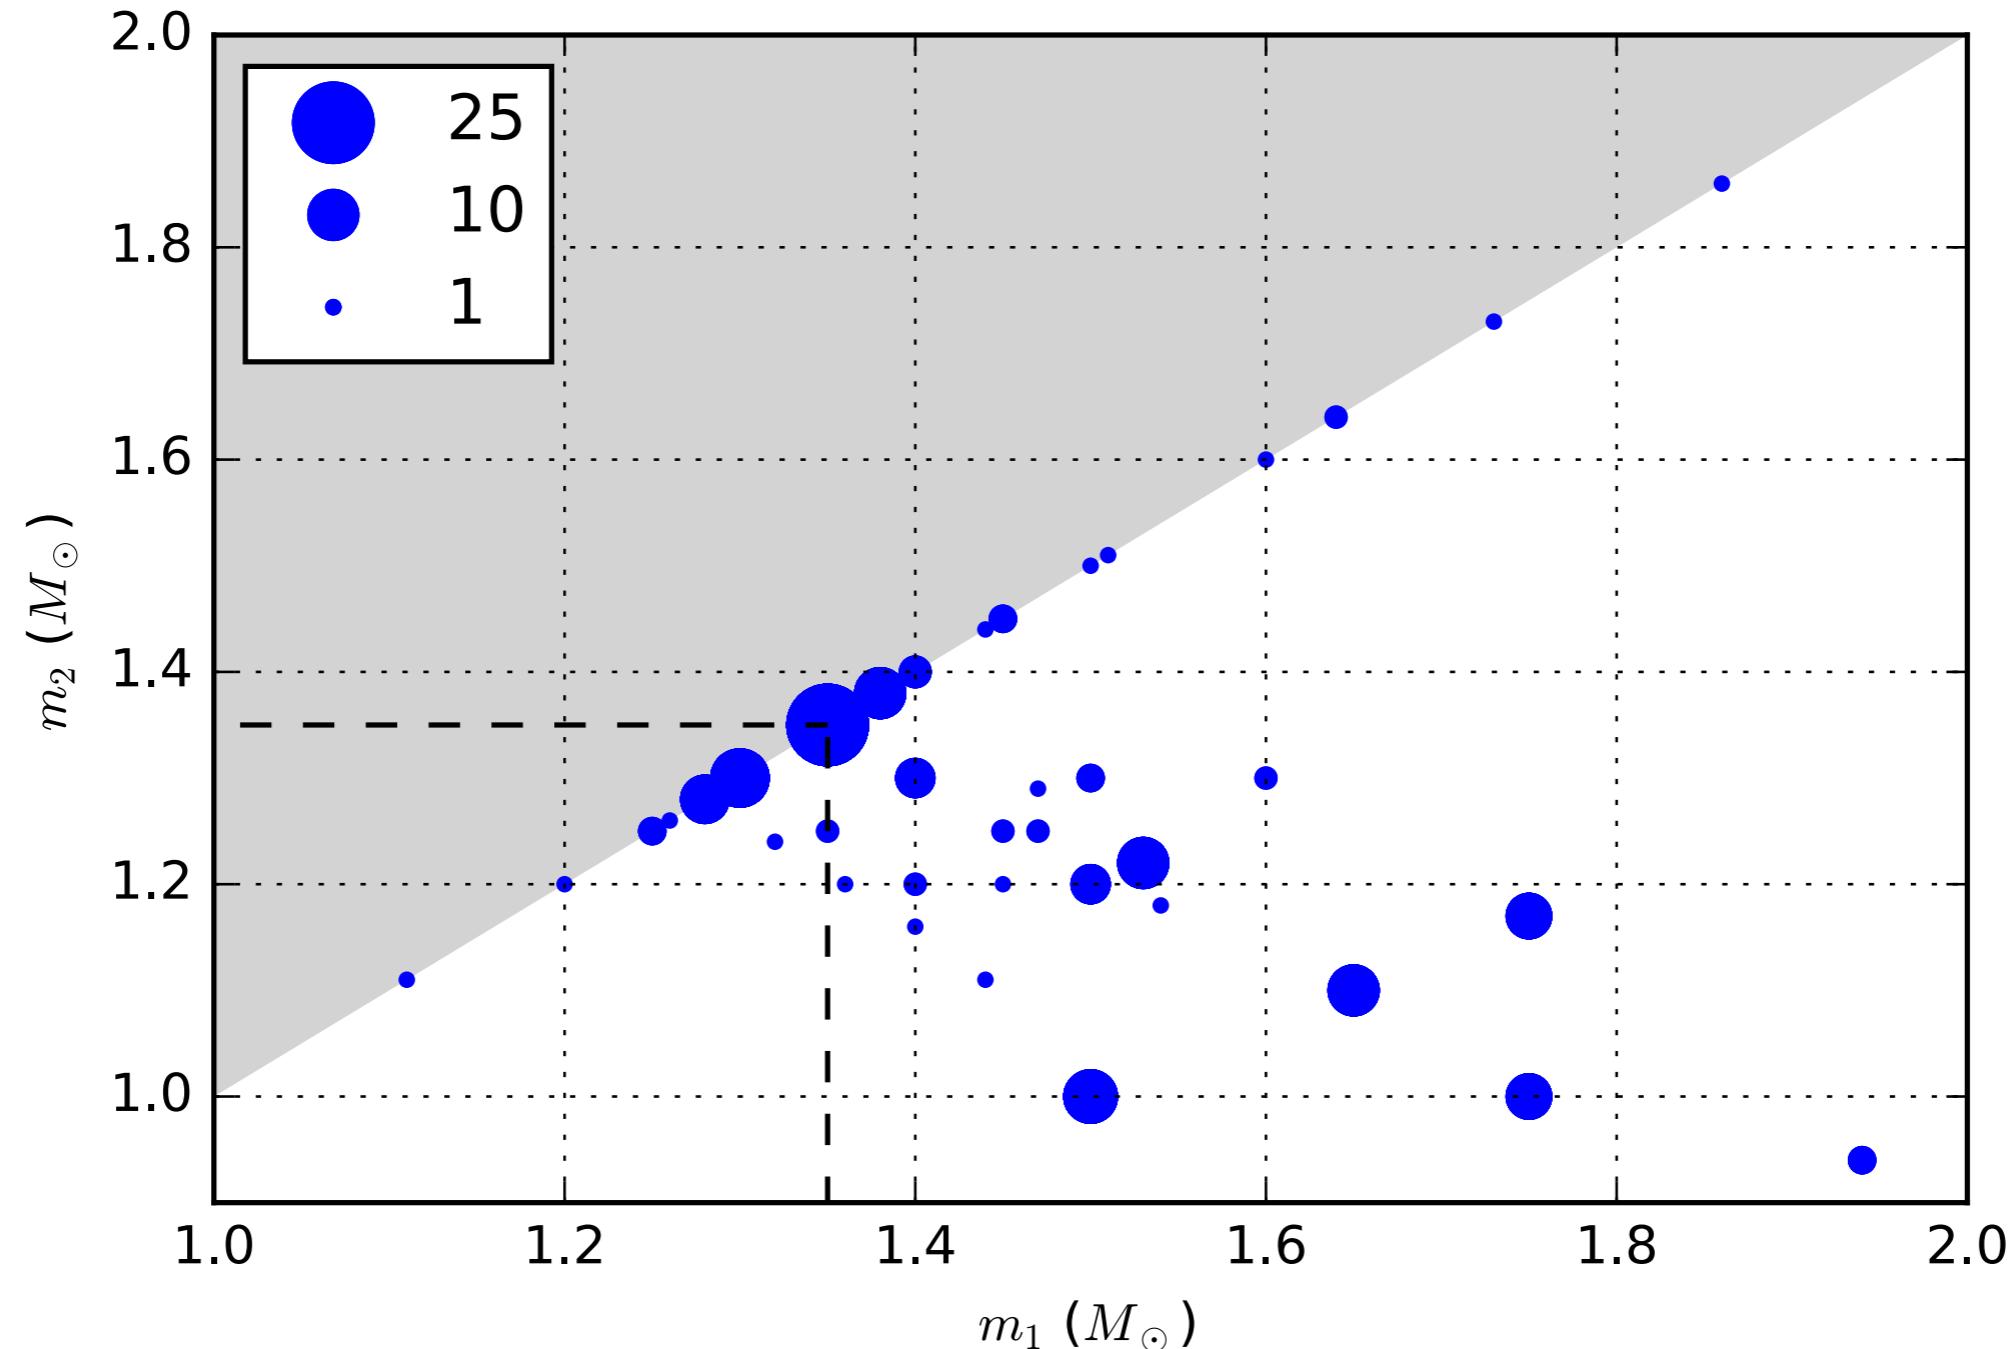

Resonant shattering illustration, D. Tsang

# Dynamics of merger: accurate waveform models

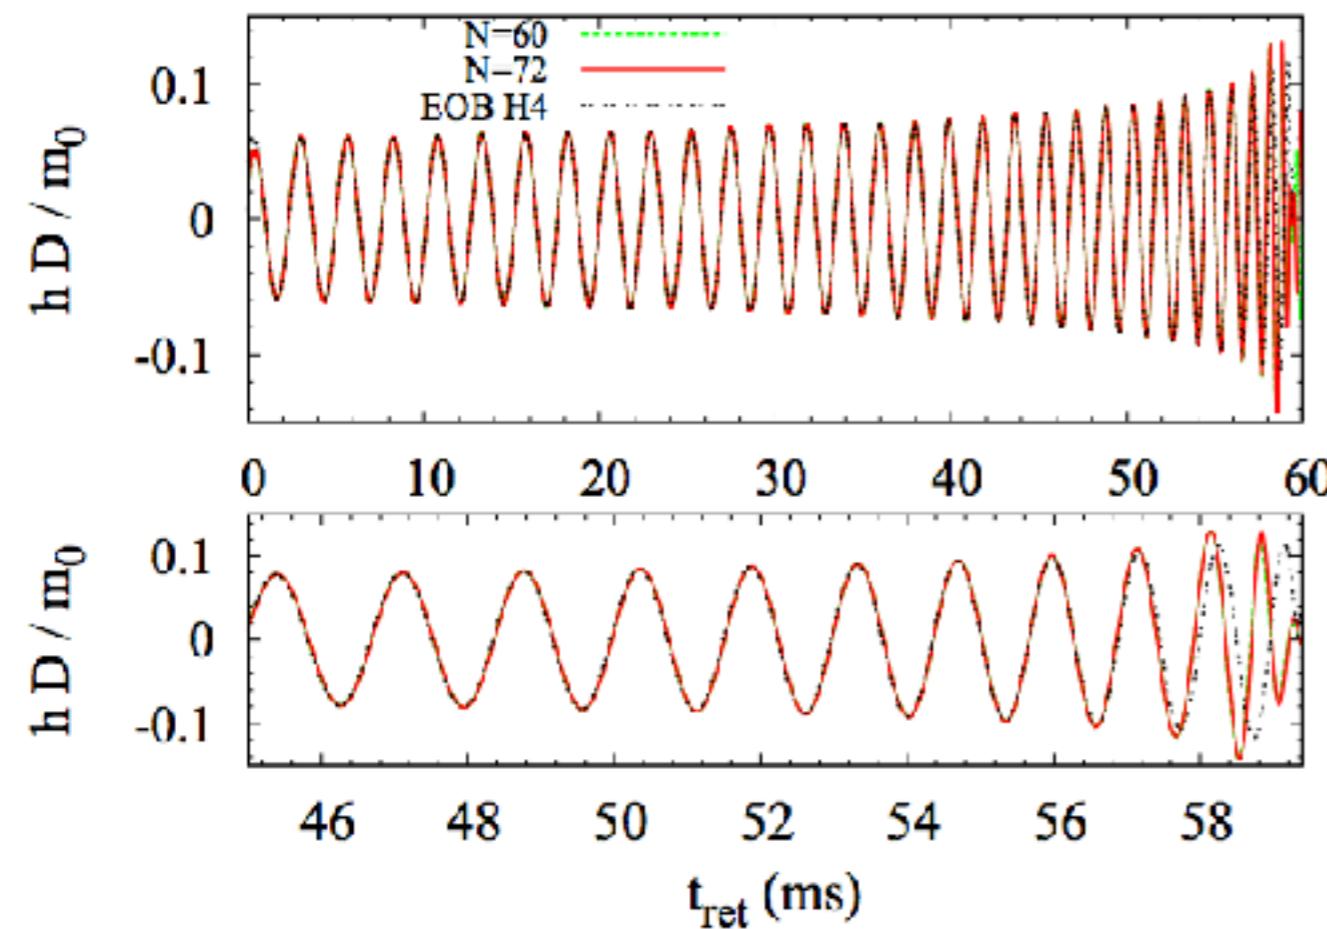

# Status of BNS simulations: coverage of parameter space

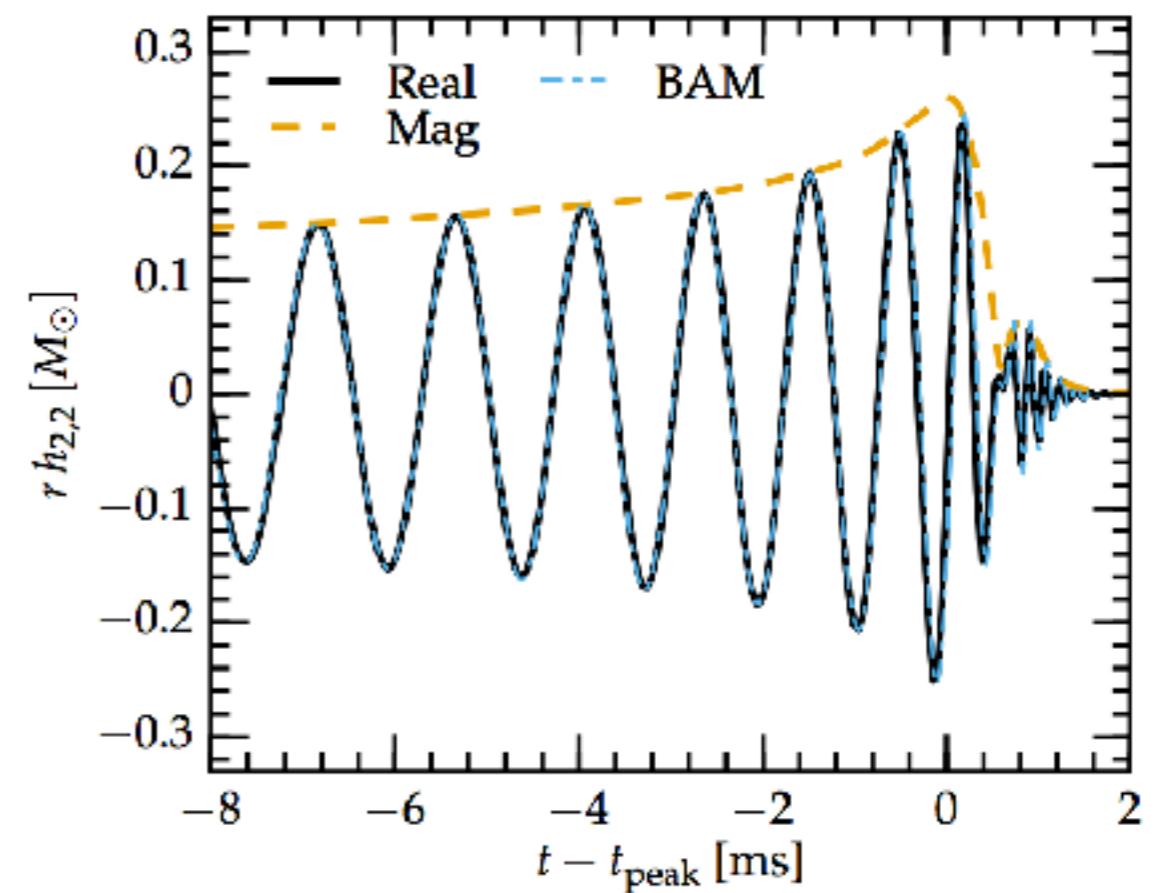

# Long and high-accuracy BNS simulations

Pannarale et al 1509.00512

# Are we ready for matter?

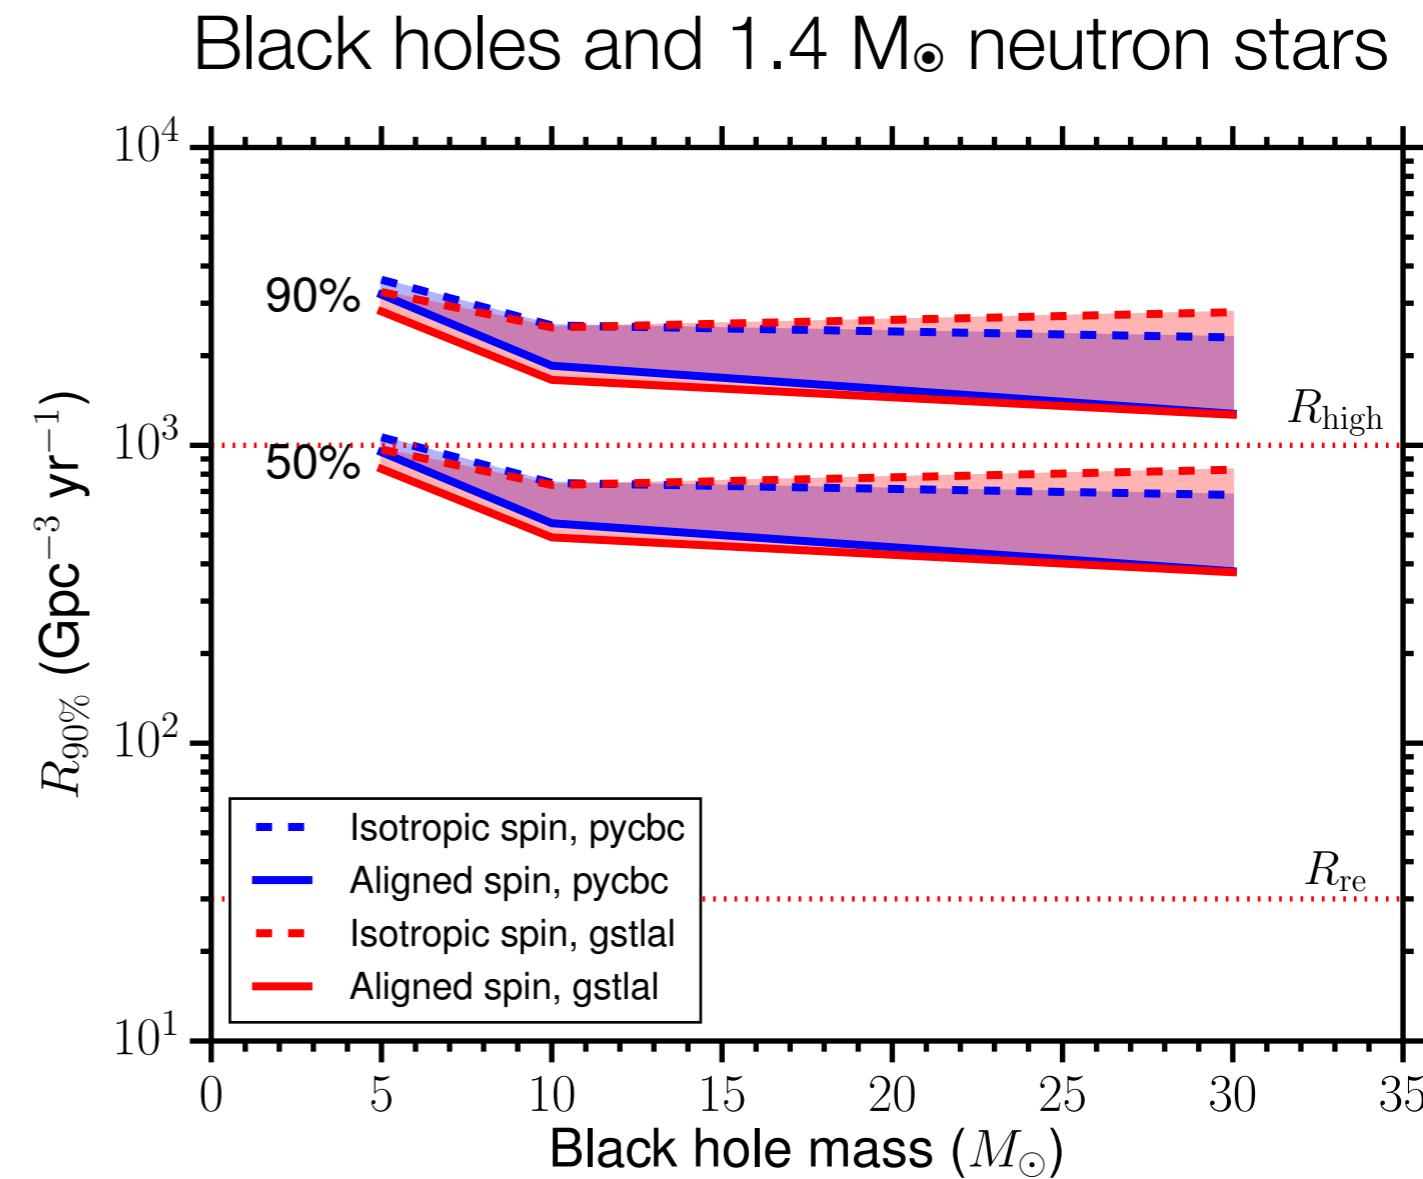

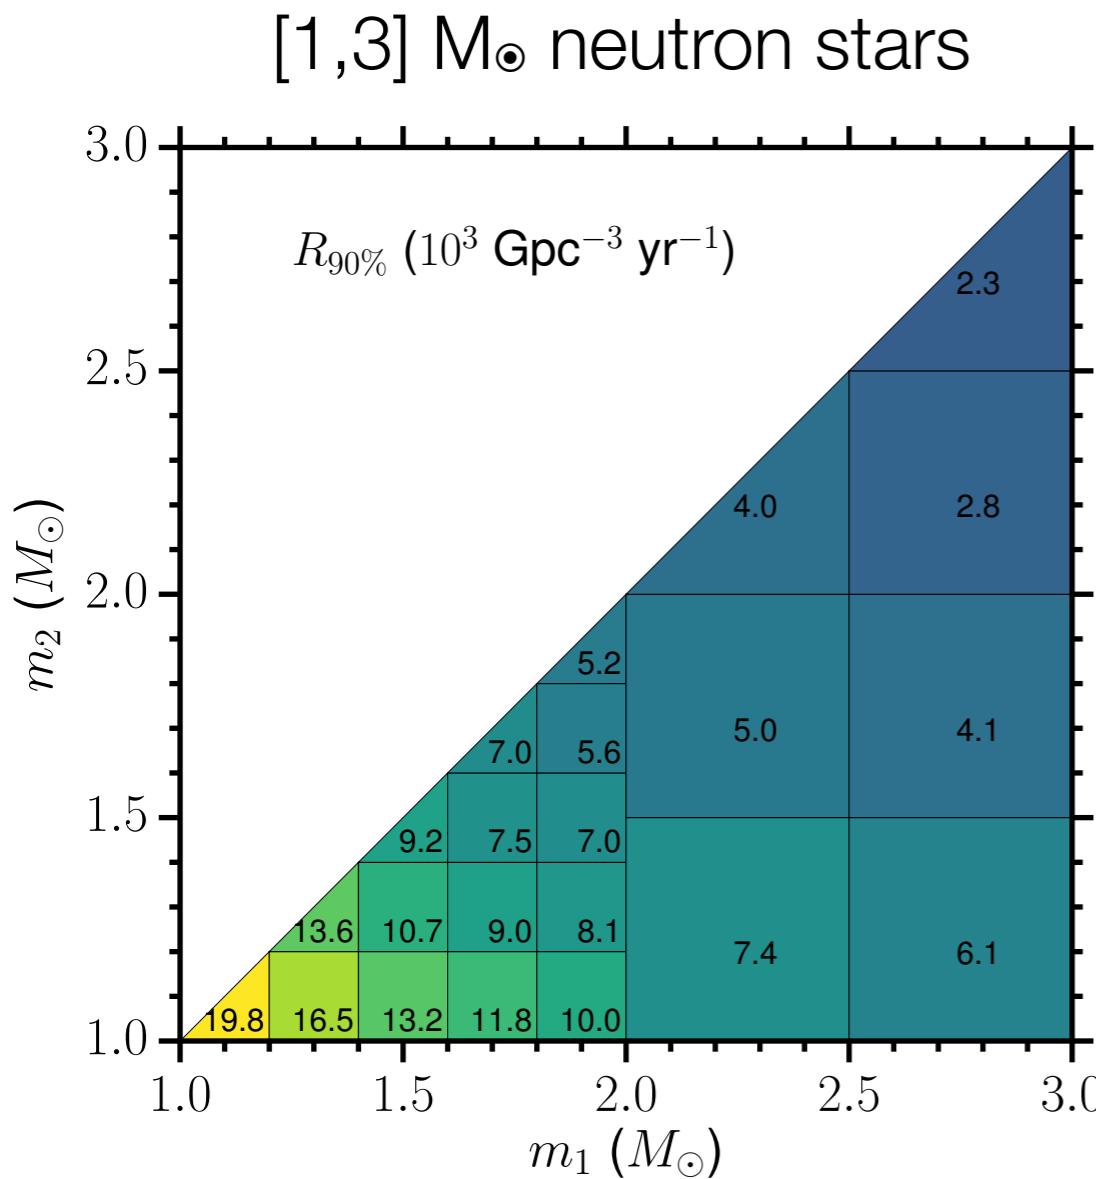

---

- Sophisticated waveform models incorporating matter are becoming available and being improved
  - Tidal EOB models for neutron stars
  - In development: Phenomenological neutron star mergers
  - Tidal EOB and Phenomenological models for disruptive NSBH mergers
- Bust follow-up can constrain post-merger
  - Possible to combine pre/post merger information?
- Careful assessment of systematic error is ongoing

# Extra slides

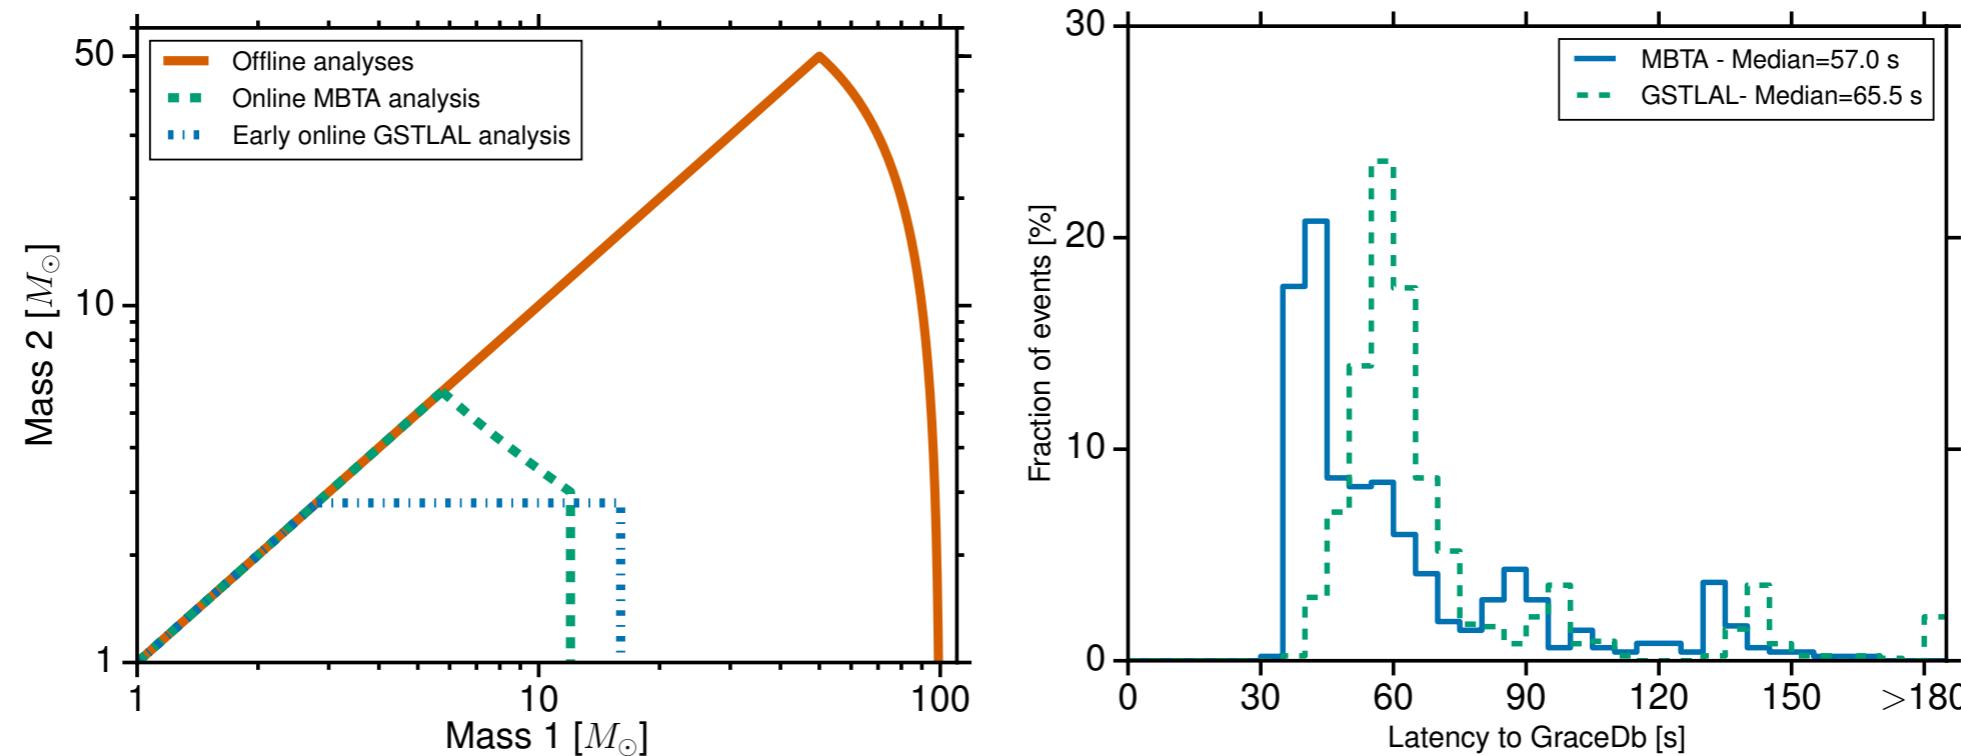

# Implications of non-detection: rate constraint

- No candidates have low-mass components (Upper limits on BNS and NSBH mergers <https://arxiv.org/abs/1607.07456>)

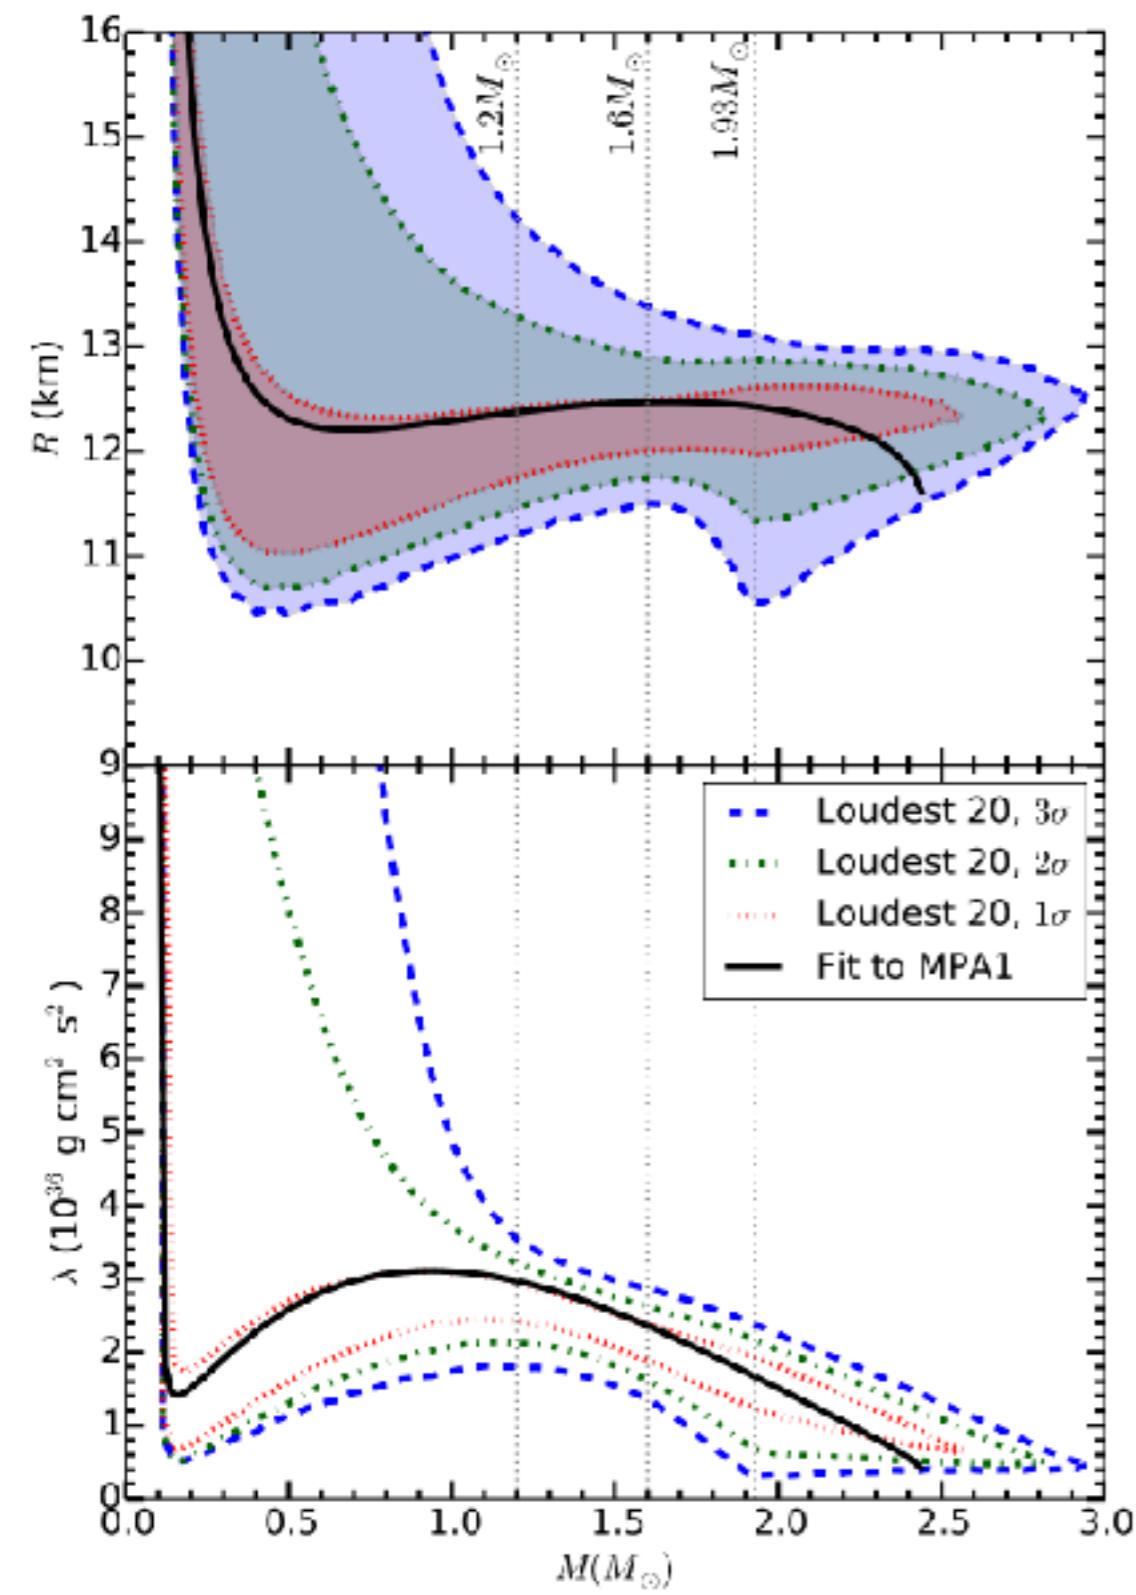

# Rapid followup

- O1 low-latency search targeted potentially EM-bright parameters of particular interest for electromagnetic followup. ([arxiv:1607.07456](https://arxiv.org/abs/1607.07456))

- O2 low-latency alerts include probability estimates for a neutron-star component and for a post-merger accretion disk
  - Notes on the EM-bright classification (<https://dcc.ligo.org/LIGO-T1600571/public>)
