

LHO Earthquakes and West Texas Fracking Impacts on CE

Lance Blagg

Mentor: Dr. Robert Schofield

Cosmic Explorer

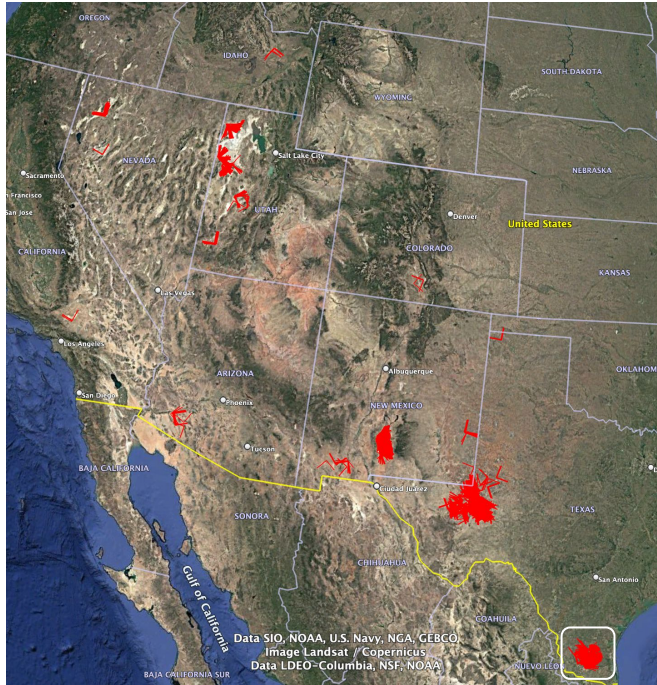

- Next big ground based detector
- 40 km arms
- Will be able to detect GWs from binaries of the first black holes

Site Selection

- Meet science goals
- Build within cost boundaries
- Attract, support and retain a diverse workforce
- Community focused model with partnerships centered around local and Indigenous communities

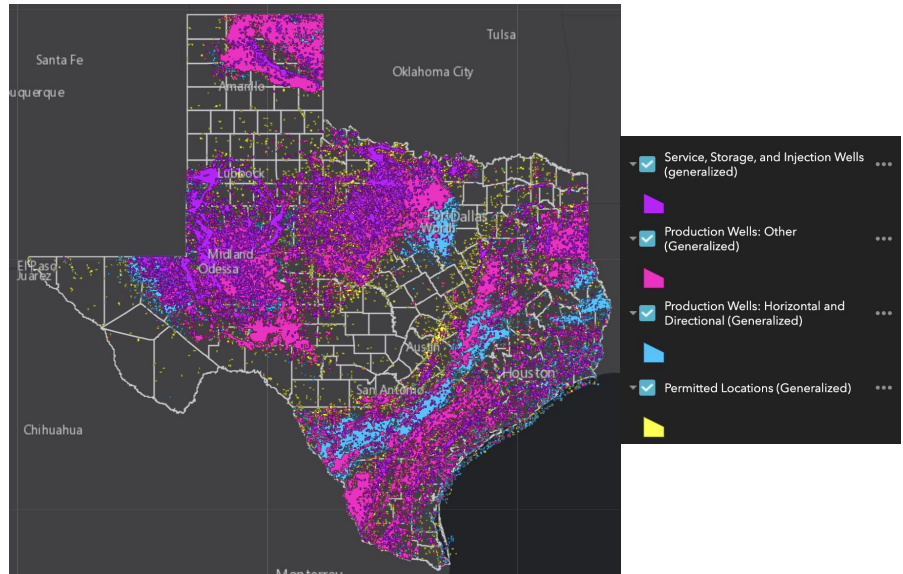

Some Potential Sites

Earthquake Study

- Goal is to help determine if fracking in Texas will be an issue for CE

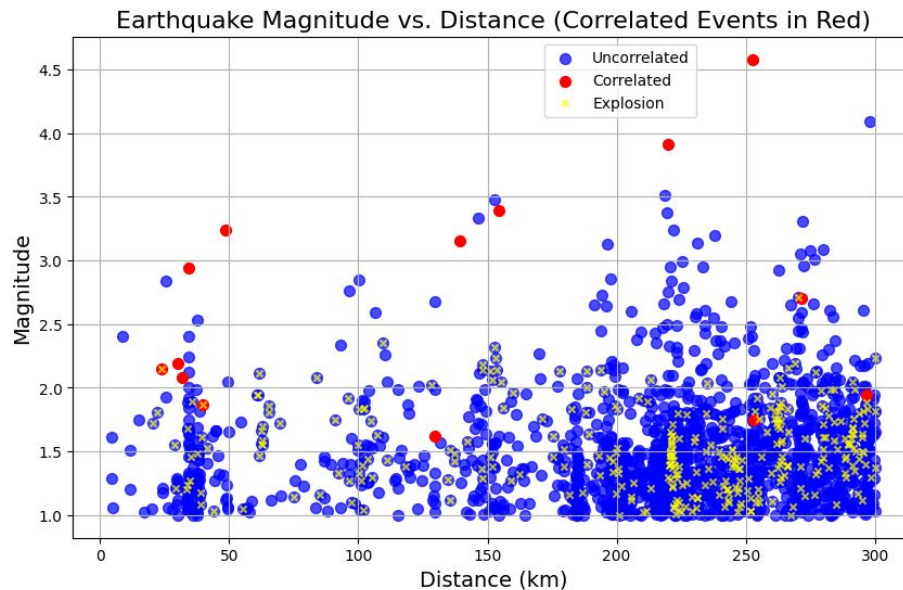

First: Analyze EQs around LHO

- **Gathered:**
 - All earthquakes (EQs) from USGS during O2, O3 and O4 (up to Feb 6) within 300km radius of LHO
 - All locklosses
 - Data for all observing times via DQSEGDB
- Removed all EQs that occurred outside of observing, leaving 1801 EQs

LHO Earthquakes and Locklosses

- Correlation criteria
 - If lockloss occurs within 120 seconds of EQ, flag as correlated
 - Slowest surface wave travel speed $\sim 2.5\text{km/s}$
 - $300\text{km}/2.5\text{km/s}=120\text{s}$
- Wanted to analyze depth but least constrained parameter

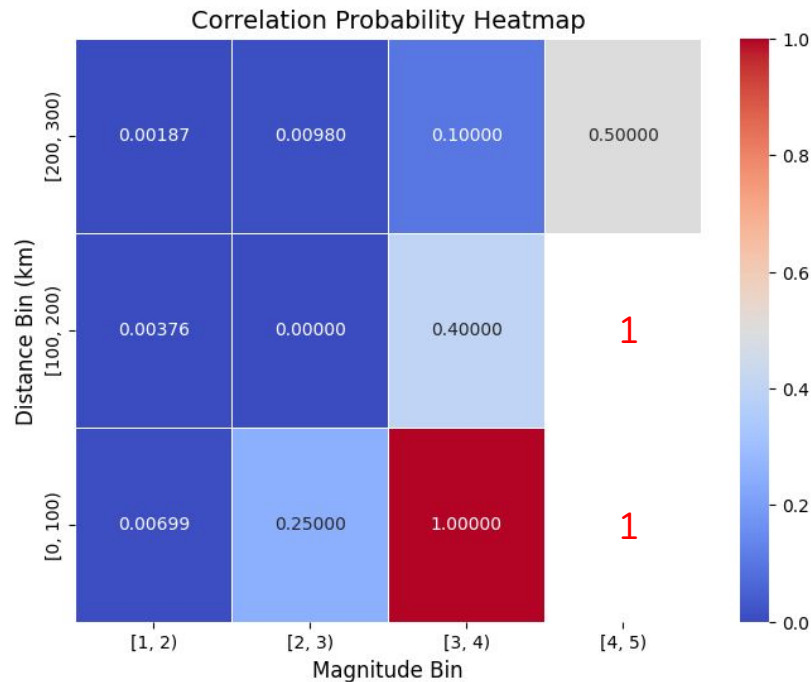

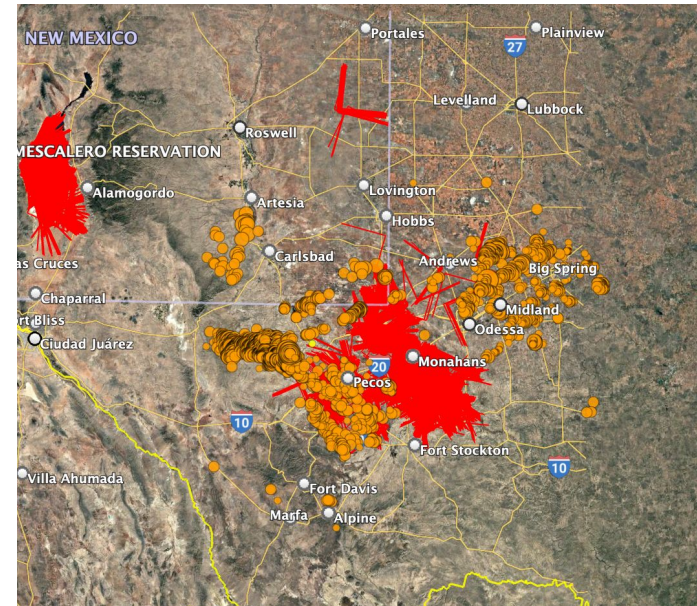

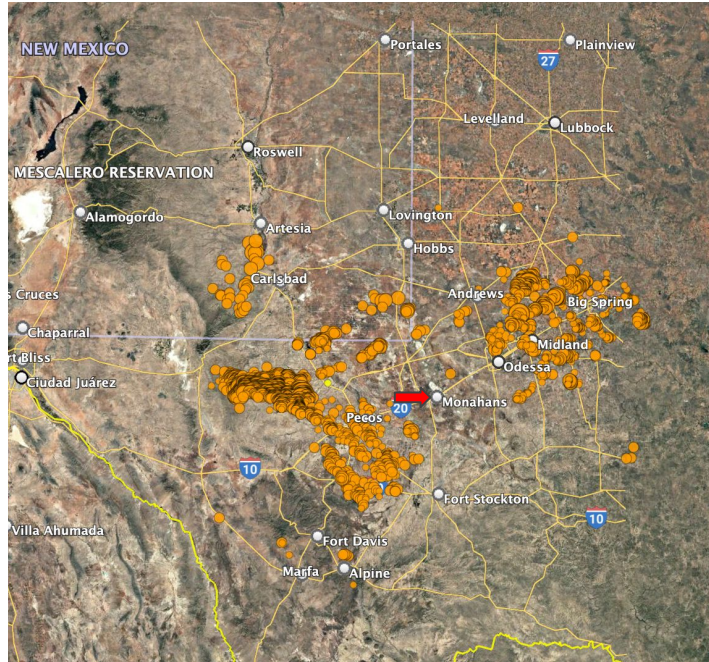

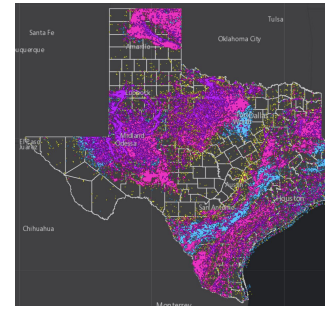

LHO Results

- 14 locklosses caused by EQs during the 3 runs, within this distance

Distance Bin	Magnitude Bin	Total Events	Correlated Events	Correlation Probability
[0, 100)	[1, 2)	143	1	0.00699
[0, 100)	[2, 3)	16	4	0.25
[0, 100)	[3, 4)	1	1	1.0
[0, 100)	[4, 5)	0	0	NaN -> 1.0
[100, 200)	[1, 2)	266	1	0.00376
[100, 200)	[2, 3)	33	0	0.0
[100, 200)	[3, 4)	5	2	0.4
[100, 200)	[4, 5)	0	0	NaN -> 1.0
[200, 300)	[1, 2)	1072	2	0.00187
[200, 300)	[2, 3)	102	1	0.00980
[200, 300)	[3, 4)	10	1	0.1
[200, 300)	[4, 5)	2	1	0.5

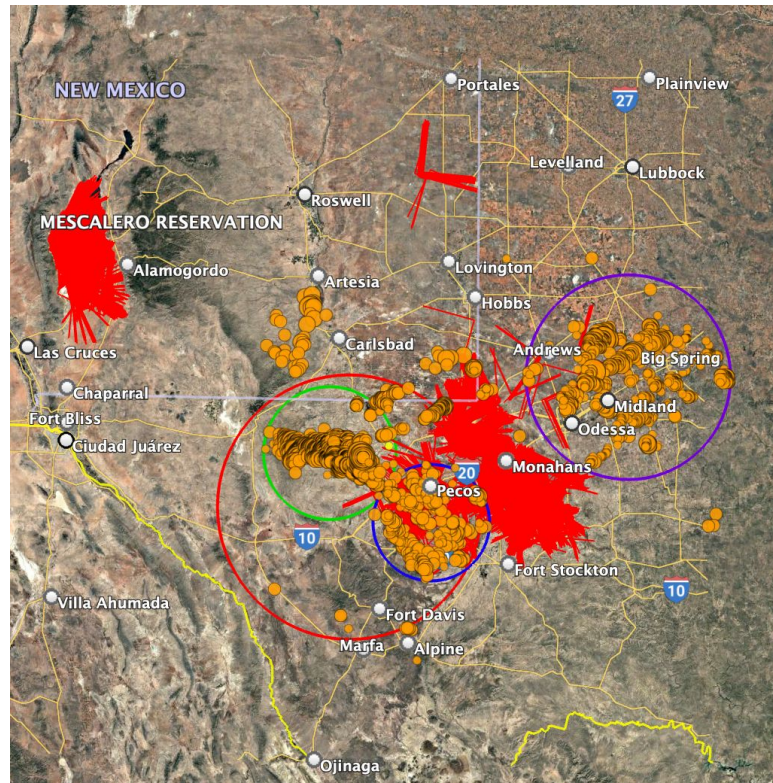

West Texas Fracking

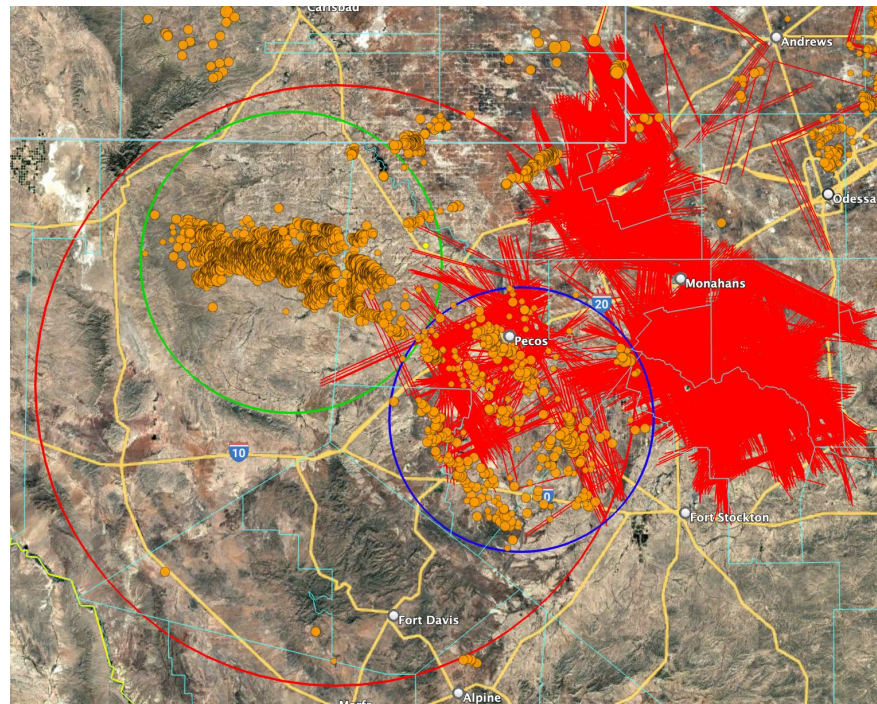

Analysis

- Pulled all EQ data from
 - 200km radius circle around Monahans, TX
 - For 1000 days prior to Jan 1, 2025 (April 7, 2022)
- 12068 EQs Total
- Divide densest pockets of EQs into “exclusion zones”
- Multiply the lockloss probabilities from LHO to get *rough* idea of how a detector would be affected

West Circles

Analysis

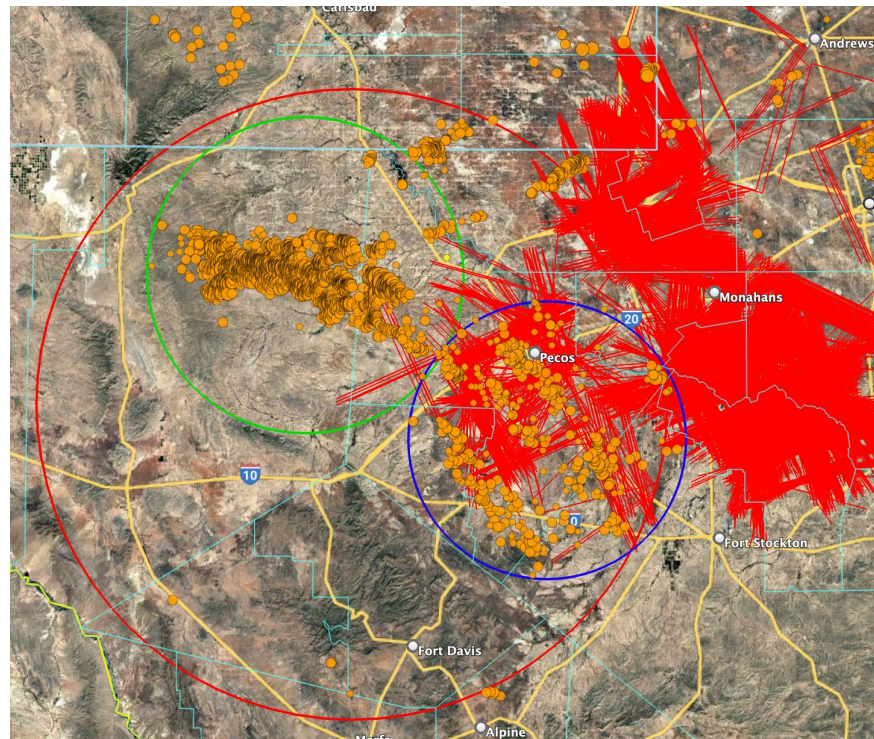

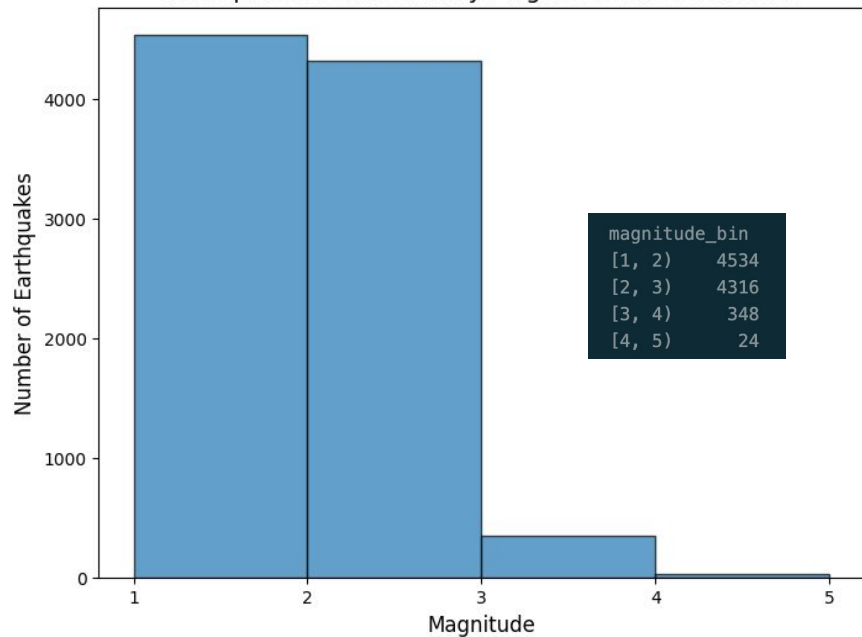

- In red circle there were 9889 EQs, comprising ~82% of EQs of sampled region, but further divided after looking at heatmap
 - Green circle: 9225 EQs (~76% of total)
 - Blue Circle: 463 EQs (~3.8%)
- Purple circle comprised 2076 EQs (~17%)
- Between green, blue and purple circles, we get 97.5% of EQs in sampled region

[0, 100)	  0.190	0.380
[100, 200)	0.033	0.067
[200, 300)	0.015	0.031

Other Things to Consider

- Haven't accounted for size of detector
- Sensitivity differences in LIGO/CE
- How much will fracking regions move? Will they increase?
- Probability table entry with 0
- ~3 EQs over magnitude 5
- Soil/land differences

Follow Up Results

- Extensive pipeline and well infrastructure in the Midland/Odessa area that might make it infeasible to build atop of

- Learned we need to focus on less densely welled/pipelined areas
- Detector *likely* placed elsewhere!
